

Radio Shack®

“The biggest name in little computers”

TRS-80®

Computer Graphics

CUSTOM MANUFACTURED IN THE USA BY RADIO SHACK, A DIVISION OF TANDY CORPORATION

TERMS AND CONDITIONS OF SALE AND LICENSE OF RADIO SHACK COMPUTER EQUIPMENT AND SOFTWARE
PURCHASED FROM A RADIO SHACK COMPANY-OWNED COMPUTER CENTER, RETAIL STORE OR FROM A
RADIO SHACK FRANCHISEE OR DEALER AT ITS AUTHORIZED LOCATION

LIMITED WARRANTY

I. CUSTOMER OBLIGATIONS

- A. CUSTOMER assumes full responsibility that this Radio Shack computer hardware purchased (the "Equipment"), and any copies of Radio Shack software included with the Equipment or licensed separately (the "Software") meets the specifications, capacity, capabilities, versatility, and other requirements of CUSTOMER.
- B. CUSTOMER assumes full responsibility for the condition and effectiveness of the operating environment in which the Equipment and Software are to function, and for its installation.

II. RADIO SHACK LIMITED WARRANTIES AND CONDITIONS OF SALE

- A. For a period of ninety (90) calendar days from the date of the Radio Shack sales document received upon purchase of the Equipment, RADIO SHACK warrants to the original CUSTOMER that the Equipment and the medium upon which the Software is stored is free from manufacturing defects. THIS WARRANTY IS ONLY APPLICABLE TO PURCHASES OF RADIO SHACK EQUIPMENT BY THE ORIGINAL CUSTOMER FROM RADIO SHACK COMPANY-OWNED COMPUTER CENTERS, RETAIL STORES AND FROM RADIO SHACK FRANCHISEES AND DEALERS AT ITS AUTHORIZED LOCATION. The warranty is void if the Equipment's case or cabinet has been opened, or if the Equipment or Software has been subjected to improper or abnormal use. If a manufacturing defect is discovered during the stated warranty period, the defective Equipment must be returned to a Radio Shack Computer Center, a Radio Shack retail store, participating Radio Shack franchisee or Radio Shack dealer for repair, along with a copy of the sales document or lease agreement. The original CUSTOMER'S sole and exclusive remedy in the event of a defect is limited to the correction of the defect by repair, replacement, or refund of the purchase price, at RADIO SHACK'S election and sole expense. RADIO SHACK has no obligation to replace or repair expendable items.
- B. RADIO SHACK makes no warranty as to the design, capability, capacity, or suitability for use of the Software, except as provided in this paragraph. Software is licensed on an "AS IS" basis, without warranty. The original CUSTOMER'S exclusive remedy, in the event of a Software manufacturing defect, is its repair or replacement within thirty (30) calendar days of the date of the Radio Shack sales document received upon license of the Software. The defective Software shall be returned to a Radio Shack Computer Center, a Radio Shack retail store, participating Radio Shack franchisee or Radio Shack dealer along with the sales document.
- C. Except as provided herein no employee, agent, franchisee, dealer or other person is authorized to give any warranties of any nature on behalf of RADIO SHACK.
- D. Except as provided herein, **RADIO SHACK MAKES NO WARRANTIES, INCLUDING WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.**
- E. Some states do not allow limitations on how long an implied warranty lasts, so the above limitation(s) may not apply to CUSTOMER.

III. LIMITATION OF LIABILITY

- A. EXCEPT AS PROVIDED HEREIN, RADIO SHACK SHALL HAVE NO LIABILITY OR RESPONSIBILITY TO CUSTOMER OR ANY OTHER PERSON OR ENTITY WITH RESPECT TO ANY LIABILITY, LOSS OR DAMAGE CAUSED OR ALLEGED TO BE CAUSED DIRECTLY OR INDIRECTLY BY "EQUIPMENT" OR "SOFTWARE" SOLD, LEASED, LICENSED OR FURNISHED BY RADIO SHACK, INCLUDING, BUT NOT LIMITED TO, ANY INTERRUPTION OF SERVICE, LOSS OF BUSINESS OR ANTICIPATORY PROFITS OR CONSEQUENTIAL DAMAGES RESULTING FROM THE USE OR OPERATION OF THE "EQUIPMENT" OR "SOFTWARE". IN NO EVENT SHALL RADIO SHACK BE LIABLE FOR LOSS OF PROFITS, OR ANY INDIRECT, SPECIAL, OR CONSEQUENTIAL DAMAGES ARISING OUT OF ANY BREACH OF THIS WARRANTY OR IN ANY MANNER ARISING OUT OF OR CONNECTED WITH THE SALE, LEASE, LICENSE, USE OR ANTICIPATED USE OF THE "EQUIPMENT" OR "SOFTWARE".
NOTWITHSTANDING THE ABOVE LIMITATIONS AND WARRANTIES, RADIO SHACK'S LIABILITY HEREUNDER FOR DAMAGES INCURRED BY CUSTOMER OR OTHERS SHALL NOT EXCEED THE AMOUNT PAID BY CUSTOMER FOR THE PARTICULAR "EQUIPMENT" OR "SOFTWARE" INVOLVED.
- B. RADIO SHACK shall not be liable for any damages caused by delay in delivering or furnishing Equipment and/or Software.
- C. No action arising out of any claimed breach of this Warranty or transactions under this Warranty may be brought more than two (2) years after the cause of action has accrued or more than four (4) years after the date of the Radio Shack sales document for the Equipment or Software, whichever first occurs.
- D. Some states do not allow the limitation or exclusion of incidental or consequential damages, so the above limitation(s) or exclusion(s) may not apply to CUSTOMER.

IV. RADIO SHACK SOFTWARE LICENSE

RADIO SHACK grants to CUSTOMER a non-exclusive, paid-up license to use the RADIO SHACK Software on **one** computer, subject to the following provisions:

- A. Except as otherwise provided in this Software License, applicable copyright laws shall apply to the Software.
- B. Title to the medium on which the Software is recorded (cassette and/or diskette) or stored (ROM) is transferred to CUSTOMER, but not title to the Software.
- C. CUSTOMER may use Software on one host computer and access that Software through one or more terminals if the Software permits this function.
- D. CUSTOMER shall not use, make, manufacture, or reproduce copies of Software except for use on **one** computer and as is specifically provided in this Software License. Customer is expressly prohibited from disassembling the Software.
- E. CUSTOMER is permitted to make additional copies of the Software **only** for backup or archival purposes or if additional copies are required in the operation of **one** computer with the Software, but only to the extent the Software allows a backup copy to be made. However, for TRSDOS Software, CUSTOMER is permitted to make a limited number of additional copies for CUSTOMER'S own use.
- F. CUSTOMER may resell or distribute unmodified copies of the Software provided CUSTOMER has purchased one copy of the Software for each one sold or distributed. The provisions of this Software License shall also be applicable to third parties receiving copies of the Software from CUSTOMER.
- G. All copyright notices shall be retained on all copies of the Software.

V. APPLICABILITY OF WARRANTY

- A. The terms and conditions of this Warranty are applicable as between RADIO SHACK and CUSTOMER to either a sale of the Equipment and/or Software License to CUSTOMER or to a transaction whereby RADIO SHACK sells or conveys such Equipment to a third party for lease to CUSTOMER.
- B. The limitations of liability and Warranty provisions herein shall inure to the benefit of RADIO SHACK, the author, owner and/or licensor of the Software and any manufacturer of the Equipment sold by RADIO SHACK.

VI. STATE LAW RIGHTS

The warranties granted herein give the **original** CUSTOMER specific legal rights, and the **original** CUSTOMER may have other rights which vary from state to state.

To Our Customers . . .

The TRS-80[®] Computer Graphics package revolutionizes your Model II by letting you draw intricate displays from simple program instructions. With the highly-defined Computer Graphic Screen, the list of practical applications is nearly endless!

The TRS-80 Computer Graphics package includes a:

- . Graphics Diskette
- . Graphics Operation Manual

However, before you can use this package, your Computer must be modified by a qualified Radio Shack service technician. Your Model II must also have 64K of RAM (Random Access Memory). The Computer Graphics package will run on the TRS-80[®] Hard Disk (Radio Shack Catalog Number 26-4150) if your Hard Disk is operating under either TRSDOS-HD (version 4.0) or TRSDOS-II (4.1).

Included on the Graphics diskette are:

- . TRSDOS 2.0a
- . Model II BASIC
- . Model II Graphics BASIC (BASICG)
- . Model II Graphics Subroutine Library
- . Graphics Utilities
- . COBOL Interface Routines (2 files)
- . Sample Programs in BASIC, Assembly, FORTRAN, and COBOL.

To print graphic displays, you can use any Radio Shack printer that has graphic capabilities such as Line Printer VII (26-1167) or a Line Printer VIII (26-1168).

Note that you can also utilize the Graphics Subroutine Library with several languages, including Assembly (26-4702), FORTRAN (26-4701), and COBOL (26-4703).

About This Manual . . .

For your convenience, we've divided this manual into seven sections plus appendixes:

- . Computer Graphics Overview
- . Graphics BASIC (BASICG) Language Description
- . Graphics Utilities

- . FORTRAN Description
- . Assembly Language Description
- . COBOL Description
- . Programming the Graphics Board
- . Appendixes

This Package contains two separate (but similar) methods for Graphics programming:

- . Graphics BASIC (BASICG)
- . Graphics Subroutine Library

If you're familiar with Model II TRSDOS™ and BASIC, you should have little trouble in adapting to Graphics BASIC. If you want to review BASIC statements and syntax, see your **Model II Owner's Manual**. Then read Chapters 1, 2 and 3, along with Appendixes A, B, E, and F of this manual.

If it's Graphics applications in FORTRAN you're after, refer to the appropriate TRS-80 language packages. Then read Chapters 1, 2, 3, and 4 as well as Appendixes C, D, E, and F of this manual.

For Assembly Language applications, read Chapters 1, 2, 3, 4, 5, and 7; then refer to Appendixes D, E, and F.

COBOL programmers should also read Chapters 1, 2, and 3, along Chapter 6 and Appendixes D, E, and F.

Note: This manual is written as a reference manual for the TRS-80 Computer Graphics package. It is not intended as a teaching guide for graphics programming.

Notational Conventions

The following conventions are used to show syntax in this manual:

CAPITALS	Any words or characters which are uppercase must be typed in exactly as they appear.
<u>lowercase underline</u>	Fields shown in lowercase underline are variable information that you must substitute a value for.
<KEYBOARD>	Any word or character contained within a box represents a keyboard key to be pressed.
...	Ellipses indicate that a field entry may be repeated.
<u>filespec</u>	A field shown as filespec indicates a standard TRSDOS file specification of the form: <u>filename/ext.password:d(diskette name)</u> Note that with TRSDOS-II, d (Drive) can be any number between 0-7.
punctuation	Punctuation other than ellipses must be entered as shown.
delimiters	Commands must be separated from their operands by one or more blank spaces. Multiple operands, where allowed, may be separated from each other by a comma, a comma followed by one or more blanks, or by one or more blanks. Blanks and commas may not appear within an operand.

1/ Computer Graphics Overview

Graphics is the presentation of dimensional artwork. With TRS-80 Computer Graphics, the artwork is displayed on a two-dimensional plane -- your Computer Screen. Like an artist's easel or a teacher's blackboard, the Screen is a "drawing board" for your displays.

TRS-80 Computer Graphics has two colors:

- . black (OFF)
- . white (ON)

Graphics programming is different from other types of programming because your ultimate result is a pictorial display (bar graph, pie chart, etc.) rather than textual display (sum, equation, etc.). This is an important distinction. After working with graphics for a while, you'll find yourself thinking "visually" as you write programs.

In computer-generated graphics, displays can include tables, charts, graphs, illustrations and other types of artwork. Once they're created, you can "paint" displays with a variety of styles and shapes, or even simulate animation.

Excellent graphics packages, such as TRS-80 Computer Graphics, have a "high resolution" screen. The more addressable points or dots (called "pixels") on a Computer's Screen, the higher the resolution. A lower resolution screen has fewer addressable pixels.

Figure 1. Resolution

Since the TRS-80 has high resolution -- 640 pixels on the X-axis (0 to 639, inclusive) and 240 pixels on the Y-axis (0 to 239, inclusive) -- you can draw displays that have excellent clarity and detail.

How TRS-80 Computer Graphics Works

The concept of graphics is fairly simple. Each point on the Screen can be turned ON (white) or OFF (black).

When you clear the Graphics Screen, all graphic points are turned OFF.

Therefore, by setting various combinations of the pixels (usually with a single command) either ON or OFF, you can generate lines, circles, geometric figures, pictures, etc.

The Graphics Subroutine Library, which is part of the TRS-80 Graphics Package, contains subroutines which provide the same capabilities, as well as similar names and parameters, as the commands and functions in Graphics BASIC. The main difference between the Subroutine Library and BASICG is the manner in which coordinates are specified (e.g., BASICG coordinates are specified as arguments for each command while the Subroutine Library specifies coordinates with a separate subroutine call). Another difference concerns the names of a few routines (e.g., LINE vs. LINEB vs. LINEBF, etc). All of these differences will be described in detail in the appropriate sections of this manual.

The Graphics Screen

TRS-80 Computer Graphics has two "screens" -- Text and Graphics. (We'll call them screens, although they are really modes.) Both screens can act independently of each other and make use of the Computer's entire display area.

The Text Screen, also referred to as the "Video Display", is the "normal" screen where you type in your programs. The Graphics Screen is where graphic results are displayed. Both Screens can be cleared independently or together. Note: The Graphics Screen will not automatically be cleared when you return to TRSDOS. It will be cleared when you re-enter BASICG unless you use the -G option. (See Options to Loading BASICG.)

The Graphics Screen can be displayed at the same time as the Text Screen. However, if the same pixel in Text and Graphic Screens overlay each other (i.e., both Screens turn the same pixel ON), the pixel will be turned OFF.

While working with Computer Graphics, it might be helpful to imagine the Screen as a large Cartesian coordinate plane (with a horizontal X- and a vertical Y-axis). However, unlike some coordinate systems, TRS-80 Graphics' coordinate numbering starts in the upper-left corner -- (0,0) -- and increases toward the lower-right corner -- (639,239). The lower-left corner is (0,239) and the upper-right corner is (639,0).

Since the Screen is divided into X-Y coordinates (like the Cartesian system), each pixel is defined as a unique position. In TRS-80 Graphics, you can directly reference these coordinates as you draw.

About Ranges...

Some TRS-80 Graphics commands accept values within the Model II integer range (-32768 to 32767), instead of just 0 to 639 for X and 0 to 239 for Y. Since most of the points in the integer range are off the Screen, these points are part of what is called Graphics "imaginary" Cartesian system.

Figure 2. Graphics Visible Screen

TRS-80[®]

Figure 3. Graphics "Imaginary" Cartesian System

Radio Shack[®]

2/ Graphics BASIC

Graphics BASIC (BASICG) vs. BASIC

The Graphics BASIC file on the supplied diskette is called BASICG.

Program files created under BASICG are not directly loadable with BASIC files (and vice versa). If you attempt to load a BASIC file in compressed format from BASICG (and vice versa), an NB error will occur. See Appendix B for a list of error messages.

The only way to load a file from one BASIC to the other is to first save the file from either BASICG or BASIC in ASCII (**SAVE**"filename/ext",A).

You can then load and run a BASIC file from either BASICG or BASIC. You cannot run programs that contain BASICG statements while in BASIC.

Important Note: Because of memory limitations, some programs (i.e., some application programs) will not run in BASICG. BASICG uses 5K more memory than BASIC. When you enter BASIC without files (i.e., you do not use the -F: option), there are 33608 bytes free. When you enter BASICG without files, there are 27784 bytes free. Some Graphics Commands use Free Memory. This means that the larger your BASIC programs are, the more limitations on your Graphic capabilities.

Each Graphics program statement has a specific syntax and incorporates a Graphics BASIC command or function.

Table 1 gives a brief description of the BASICG commands; Table 2 lists the BASICG functions. This section of the manual will describe each statement and function in detail.

=====
BASICG Commands
 =====

Command	Description
CIRCLE	Draws a circle, arc, semi-circle, etc.
CLS	Clears either the Text or Graphics Screen or both.
GET	Reads contents of a rectangle on the Graphics Screen into an array for future use by PUT.
LINE	Draws a line from the startpoint to endpoint in the specified line style and color. Also creates a box.
PAINT	Paints an area, starting from a specified point. Also paints a specified style.
PRESET	Sets an individual dot (pixel) OFF (or ON).
PSET	Sets an individual dot (pixel) ON (or OFF).
PUT	Stores graphics from an array onto the Graphics Screen.
SCREEN	Turns Graphics Screen on or off and selects display speed.
VIEW	Creates a viewport which becomes the current Graphics Screen.

 =====
Table 1

=====
BASICG Functions
 =====

Function	Description
POINT	Returns the OFF/ON color value of a pixel.
VIEW	Returns the current viewport coordinates.

 =====
Table 2
 =====
Starting-Up

Before using the diskette included with this package, be sure to make a "safe copy" of it. See your Model II Owner's Manual for information on BACKUP.

To load BASICG:

1. Power up your System according to the start-up procedure in your Model II Owner's Manual.
2. Insert the backup diskette into Drive Ø.
3. Initialize the System as described in the Operation section of the Model II Owner's Manual.
4. When TRSDOS READY appears, type:

BASICG <ENTER>

The Graphics BASIC start-up message, followed by the Ready prompt (>), appears and you are in Graphics BASIC. You can now begin BASICG programming.

Options to Loading BASICG

There are three options you can use when loading BASICG. When you enter Graphics BASIC without an option (i.e., BASICG <ENTER>), the Graphics Screen is cleared.

BASICG -G: <ENTER>

The -G option lets you enter BASICG without clearing the Graphics Screen.

TRS-80[®]

BASICG -F:files <ENTER>

This option works exactly like -F which is described in the Model II Owner's Manual. Refer to that manual for details.

BASICG -M:address <ENTER>

This option also works exactly as described in the Model II Owner's Manual.

These options may be combined. For example, if you do not want to clear the Graphics Screen but you do want to allocate three files, type:

BASICG -G: -F:3 <ENTER>

Additionally, a BASICG program name in standard format can be specified when you enter BASICG from TRSDOS. Upon entry into BASICG, the program will be loaded and executed.

Remember that Model II numeric values are as follows:

Model II Numeric Values			
Numeric Type	Range	Storage Requirement	Example
Integer	-32768, 32767	2 bytes	240, 639, -10
Single-Precision	-1*10 ³⁸ , -1*10 ⁻³⁸ +1*10 ³⁸ , +1*10 ⁻³⁸ Up to 7 significant digits (Prints six)	4 bytes	22.50, 3.14259 -100.001
Double-Precision	-1*10 ³⁸ , -1*10 ⁻³⁸ +1*10 ³⁸ , +1*10 ⁻³⁸ Up to 17 significant digits (Prints only 16)	8 bytes	1230000.00 3.1415926535897932

Table 3

See your Model II Owner's Manual for more details on Numeric Data Types.

With each BASICG command or function, there are various options which you may or may not include in a program

statement (depending on your needs). Each option is separated from the previous option by a delimiter, usually a comma. When you do not specify an available option (e.g., you use the default value) and you specify subsequent options, you must still enter the delimiter or a Syntax Error will result. (See your Model II Owner's Manual for more information).

CIRCLE

Draws Circle, Semi-Circle, Ellipse, Arc, Point

CIRCLE (x,y),r,c,start,end,ar

x and y specifies the centerpoint of the figure. x and y are integer expressions.
r specifies the radius of the figure in pixels and is a positive integer expression.
c specifies the OFF/ON color of the figure and is a integer expression of either 0 (OFF/black) or 1 (ON/white). c is optional; if omitted, 1 is used.
start specifies the startpoint of the figure and is a numeric expression from 0 to 6.283185. start is optional; if omitted, 0 is used.
end specifies the endpoint of the figure and is a numeric expression from 0 to 6.283185. end is optional; if omitted, 6.283185 is used.
ar specifies the aspect ratio of the circle, is a single-precision floating-point number > 0.0 (to 1×10^{38}) and determines the major axis of the figure. ar is optional; if omitted, .5 is used and a circle is drawn.

The CIRCLE command lets you draw five types of figures:

Figure 4. Types of Displays with CIRCLE

With CIRCLE, you can enter values for PI (and 2 x PI) up to 37 significant digits:

```
3.1415926535897932384626433832795028841
6.2831853071795864769252867665590057682
```

without getting an overflow error. However, you'll probably only be able to visually detect a change in the circle's start and end when PI is accurate to a few significant digits (e.g., 3.1, 6.28, etc.). The start and end values can't be more than 2 x PI (e.g., 6.2832 will not work) or an Illegal Function Call error will occur.

**(x,y)
Centerpoint**

The (x,y) coordinates in the CIRCLE statement specify the centerpoint of the figure. x and y are numeric expressions in the integer number range.

Example

```
CIRCLE (x,y),r
```

```
CIRCLE (32Ø,12Ø),r
```

Figure 5. Center of Circle

r**Radius**

The radius of a circle is measured in pixels and is a numeric expression in the integer range. Radius is the distance from the centerpoint to the edge of the figure.

The radius is either on the X-axis or Y-axis, depending on aspect ratio (see ar). If the aspect ratio is greater than 1, the radius is measured on the Y-axis. If the aspect ratio is less than or equal to 1, the radius is measured on the X-axis.

Example

```
1Ø CIRCLE(32Ø,12Ø),1ØØ
```

This example draws a circle. The radius is 1ØØ and the centerpoint is (32Ø,12Ø).

c**Color**

You can set the ON/OFF (white/black) color of a figure's border and radius lines (see start/end) by specifying a numeric value of 1 or Ø.

If you omit color, BASICG uses 1 (ON/white).

Figure 6. Border of Circle

start/endStartpoint/Endpoint of Circle

The range for start and end is \emptyset to 6.283185 ($2 \times \text{PI}$).

If you do not enter start and end, the default values of \emptyset and 6.28 respectively, are used.

A negative start or end value will cause the respective radius to be drawn in addition to the arc (i.e., it will draw a "piece of the pie"). The actual start and endpoints are determined by taking the absolute value of the specified start and endpoints. These values are measured in radians.

Note: Radius will not be drawn if start or end is $-\emptyset$. To draw a radius with start or end as \emptyset , you must use $-\emptyset.\emptyset\emptyset\emptyset\dots\emptyset 1$.

Figure 7. Clock/Radian Equivalents

Degrees	Radians	Clock Equivalent
0	0	3:00
90	1.57	12:00
180	3.14	9:00
270	4.71	6:00
360	6.28	3:00

Table 4. Degree/Radians/Clock Equivalents

You can draw semicircles and arcs by varying start and end. If start and end are the same, a point (one pixel) will be displayed instead of a circle.

Figure 8. CIRCLE's (-) start, (-) end

You can have a positive start and a negative end (or vice versa) as well as having negative starts and ends. In these cases, only one radius line is drawn.

Figure 9. CIRCLE's (+) start, (-) end

Hints and Tips about start and end:

- When using the default values for start and end, you must use commas as delimiters if you wish to add more parameters.
- If you use PI, it is not a reserved word in BASICG and must be defined in your program.

**ar
Aspect Ratio**

You can draw ellipses by varying the aspect ratio from the default value (.5) for a circle (and semi-circle).

Every ellipse has a "major axis" which is the ellipse's longer, predominant axis. With an ellipse (as with a circle), the two axes are at right angles to each other.

The mathematical equation for determining the aspect ratio is:

$$\underline{ar} = \underline{\text{length of Y-axis}} / \underline{\text{length of X-axis}}$$

- If the aspect ratio is .5, a circle is drawn.
- If the ratio is less than .5, an ellipse with a major axis on the X-axis is drawn.
- If the ratio is greater than .5, an ellipse with a major axis on the Y-axis is drawn.

X-Axis Ellipse (ar < .5)

Y-Axis Ellipse (ar > .5)

Figure 1Ø. CIRCLE's Ellipse

The range for aspect ratio is a single-precision floating-point number greater than 0.0 (to 1×10^{38}). See your Model II Owner's Manual for more information.

Hints and Tips about aspect ratio:

- . Entering .5 as the ratio produces a circle.
- . Number between 0 and .5 produce an ellipse with a major axis on X.
- . Number over .5 generate an ellipse with a major axis on Y.
- . Even though you can enter large aspect ratios, large numbers may produce straight lines.

Examples

```
CIRCLE (320,120),90,1
```

This example draws a white-bordered circle with the centerpoint of (320,120) and radius of 90.

```
CIRCLE (320,120),90,1,,,7
```

This statement draws a white-bordered ellipse with an origin of (320,120) and radius of 90. The major axis is the Y-axis.

```
CIRCLE (320,120),90,1,-6.2,-5
```

This statement draws an arc with a vertex ("origin") of (320,120) and radius of 90. start is 6.2 and end is 5. Radius lines are drawn for start and end.

```
CIRCLE (320,120),90,1,-,-4
```

This example draws an arc with a vertex of (320,120) and radius of 90. start is 0 and end is 4. A radius line is drawn for end.

```

10 PI=3.1415926
20 CIRCLE (320,120),100,1,PI,2*PI,.5

```

A semi-circle is drawn.

```

10 CIRCLE (150,100),100,1,-5,-1
20 CIRCLE (220,100),100,1,5,1

```

Two arcs are drawn with the same start and end point. The arc with the negative start and end has two radius lines drawn to the vertex. The arc with a positive start and end has no radius lines.

```

CIRCLE (320,120),140,, -4,6.1

```

This statement draws an arc with a vertex at (320,120) and a radius of 140. Start is 4 and end is 6.1. A radius line is drawn for start.

```

CIRCLE (320,120),140,1,0,1,.5

```

This example draws an arc with a vertex of (320,120) and radius of 140.

Sample Program

```

5 CLS 2
10 FOR X=10 TO 200 STEP 10
20 CIRCLE (300,100),X,1,,.9
30 NEXT X
40 FOR Y=10 TO 200 STEP 10
50 CIRCLE (300,100),Y,1,,.1
60 NEXT Y
70 FOR Z=10 TO 200 STEP 10
80 CIRCLE (300,100),Z,1,,.5
90 NEXT Z
100 GOTO 5

```

A set of 20 concentric ellipses is drawn with a major axis on Y, a set of 20 concentric ellipses is drawn with a major axis on X, and a set of 20 concentric circles is drawn. The ellipses and circles in each of the three groups are concentric and the radius varies from 10 to 200.

CLS

Clears Screen(s)

CLS n

n is a integer expression from 0 to 2 and specifies which Screen (Text or Graphics or both) is to be cleared. CLS 0 clears the Text Screen, CLS 1 clears the Graphic Screen, CLS 2 clears both the Graphics and Text Screens. n is optional; if omitted, 0 is used.

CLS clears the Screen according to the specified variable.

Examples

```
10 CIRCLE(320,120),100,1
```

This program line will draw a circle. Now type:

```
CLS <ENTER>
```

and the Text Screen will be cleared but the Graphics Screen will remain.

Type:

```
CLS 2 <ENTER>
```

and both the Graphics and Text Screen will be cleared.

Run the program again and type:

```
CLS 1 <ENTER>
```

and the Graphics Screen will be cleared but the Text Screen will remain.

GET

Reads Contents of Rectangular Pixel Area into Array

GET(x1,y1)-(x2,y2),array name

(x1,y1) are coordinates of one of the opposing corners of a rectangular pixel area. x1 is an integer expression from 0 to 639. y1 is an integer expression from 0 to 239.

(x2,y2) are coordinates of the other corner of a rectangular pixel area. x2 is an integer expression from 0 to 639. y2 is an integer expression from 0 to 239.

array name is the name you assign to the array that will store the rectangular area's contents. array name must be specified.

Important Note: BASICG recognizes two syntaxes of the command GET -- the syntax described in this manual and the syntax described in the Model II Owner's Manual. BASIC recognizes only the GET syntax described in the Model II Owner's Manual.

GET reads the graphic contents of a rectangular pixel area into a storage array for future use by PUT (see PUT).

A rectangular pixel area is a group of pixels which are defined by the diagonal line coordinates in the GET statement.

The first two bytes of array name are set to the horizontal (X-axis) number of pixels in the pixel area; the second two bytes are set to the vertical (Y-axis) number of pixels in the pixel area. The remainder of array name represents the status of each pixel, either ON or OFF, in the pixel area. The data is stored in a row-by-row format. The data is stored 8 pixels per byte and each row starts on a byte boundary.

Array Limits

When the array is created, BASICG reserves space in memory for each element of the array. The size of the array is limited by the amount of memory available for use by your

program -- each real number in your storage array uses four memory locations (bytes).

The array must be large enough to hold your graphic display and the rectangular area must include all the points you want to store.

Your GET rectangular pixel area can include the entire Screen (i.e., GET(0,0)-(639,239),array name), if the array is dimensioned large enough.

To determine the minimum array size:

1. Divide the number of X-axis pixels by 8 and round up to the next highest integer.
2. Multiply the result by the number of Y-axis pixels. When counting the X-Y axis pixels, be sure to include the first and last pixel.
3. Add four to the total.
4. Divide by four (for real numbers) or two (for integers) rounding up to the next higher integer.

The size of the rectangular pixel area is determined by the (x,y) coordinates used in GET:

Position: upper-left corner = startpoint = (x1,y1)
 lower-left corner = endpoint = (x2,y2)

Size (in pixels): width = x2-x1+1
 length = y2-y1+1

Examples

GET(10,10)-(80,50),V

This block is 71-pixels wide on the X-axis (10 through 80, inclusive) and 41 long on the Y-axis (10 through 50, inclusive).

- . For real: $71/8 = 9 * 41 = 369 + 4 = 373/4 = 94$
- . For integer: $71/8 = 9 * 41 = 369 + 4 = 373/2 = 187$

Depending on the type of array you use, you could set up your minimum-size dimension statement this way:

- . Real DIM V(93)
- or
- . Integer DIM V%(186)

Examples

```

10 DIM V(249)
20 CIRCLE (65,45),20,1
30 GET (10,10)-(120,80),V

```

An array is created, a circle is drawn and stored in the array via the GET statement's rectangular pixel area's parameters (i.e., (10,10)-(120,80)).

Calculate the dimensions of the array this way:

Rectangular pixel area is 111 x 71. That equals:

$$111/8 = 14 * 71 = 994 + 4 = 998/4 = 250$$

Figure 11

```

10 DIM V(30,30)
20 CIRCLE (50,50),10
30 GET (10,10)-(80,80),V

```

A two-dimensional array is created, a circle is drawn and stored in the array via the GET statement's rectangular pixel area's parameters (i.e., (10,10)-(80,80)).

Figure 12

```

10 DIM V%(564)
20 CIRCLE (65,45),50,1,1,3
30 GET(10,10)-(80,80),V%

```

A one-dimensional integer array is created, an arc is drawn and stored in the array via the GET statement's rectangular area's parameters.

LINE

Draws a Line or Box

LINE (x1,y1)-(x2,y2), c, B or BF, style

(x1,y1) specifies the starting coordinates of a line and is a pair of integer expressions.

(x1,y1) is optional; if omitted, the last ending coordinates of any previous command are used as the startpoint. If a command has not been previously specified, (\emptyset,\emptyset) is used.

(x2,y2) specifies the ending coordinates of a line.

(x2,y2) is a pair of integer expressions.

c specifies the color and is a numeric expression of either \emptyset or 1. c is optional; if omitted, 1 is used.

B or BF specifies drawing and/or shading (solid white only) a box. B draws a box and BF fills a box with shading. B/BF is optional; if omitted, only a line is drawn.

style is the setting for the pattern of a line and is a numeric value in the integer range. style is optional; if omitted, -1 (solid line) is used. style must be omitted if BF is used.

LINE draws a line from the starting point (x1,y1) to the ending point (x2,y2).

If the starting point is omitted, either (\emptyset,\emptyset) is used if a previous end coordinate has not been specified or the last ending point of the previous command is used. If one or both parameters are off the Screen, only the part of the line which is visible is displayed.

With over 65,500 line styles possible, each style is slightly different. You'll find it's almost impossible to detect some of the differences since they are so minute.

LINE with Box Option

The start and end coordinates are the diagonal coordinates of the box (either a square or rectangle). When you don't specify the B option, the "diagonal" line is drawn -- not the perimeter of the rectangle. When you do specify the B option, the perimeter is drawn but not the diagonal line.

```
LINE(140,80)-(500,200),1,B
```

(140,80)

(500,200)

Figure 13

style

style sets the pixel arrangement in 16-bit groups.

For example, 0000 1111 0000 1111 (binary), 0F0F (hex), or 3855 (decimal).

style can be any number in the integer range (negative or positive). Using hexadecimal numbers, you can figure the exact line style you want. There will always be four numbers in the hexadecimal constant.

To use hexadecimal numbers for style:

1. Decide what pixels you want OFF (bit=0) and ON (bit=1).
2. Choose the respective hexadecimal numbers (from the Base Conversion Chart, Appendix E).

Example

```
0000 1111 0000 1111    &H0F0F
```

Creates a dashed line.

type	binary numbers	hex numbers
long dash	0000 0000 1111 1111	&H00FF
short dash	0000 1111 0000 1111	&H0F0F
"short-short" dash	1100 1100 1100 1100	&HCCCC
solid line	1111 1111 1111 1111	&HFFFF
OFF/ON	0101 0101 0101 0101	&H5555
"wide" dots	0000 1000 0000 1000	&H0808
medium dots	1000 1000 1000 1000	&H8888
dot-dash	1000 1111 1111 1000	&H8FF8

Table 5. Sample Line Styles

Example

```
LINE -(100,40)
```

This example draws a line in white (ON) starting at the last endpoint used and ending at (100,40).

```
LINE (0,0)-(319,199)
```

This statement draws a white line starting at (0,0) and ending at (319,199).

```
LINE(100,100)-(200,200),1,,45
```

This example draws a line from (100,100) to (200,200) using line style 45 (&H002D).

```
LINE (100,100)-(300,200),1,,&H00FF
```

This LINE statement draws a line with "long dashes". Each dash is eight pixels long and there are eight blank pixels between each dash.

```
LINE (100,100)-(300,200),1,-1000
```

This statement draws a line from (100,100) to (300,200) using line style -1000.

```
LINE (200,200)-(-100,100)
```

A line is drawn from the startpoint of (200,200) to (-100,100).

```
10 LINE (30,30)-(180,120)
```

```
20 LINE -(120,180)
```

```
30 LINE -(30,30)
```

This program draws a triangle.

```
10 LINE -(50,50)
```

```
20 LINE -(120,80)
```

```
30 LINE -(-100,-100)
```

```
40 LINE -(3000,1000)
```

This program draws four line segments using each endpoint as the startpoint for the next segment.

PAINT

Paints Screen

PAINT (x,y), tiling, border, background

(x,y) specifies the X-Y coordinates where painting is to begin. x is a numeric expression from 0 to 639 and y is a numeric expression from 0 to 239.

tiling specifies the paint style and can be a string or a numeric expression. tiling is optional; if omitted, 1 is used. tiling cannot be a null string ("") and no more than 64 bytes may be contained in the tiling string.

border specifies the OFF/ON color of the border where painting is to stop and is a numeric expression of either 0 (OFF) or 1 (ON). border is optional; if omitted, 0 is used.

background specifies the color of the background that is being painted and is a 1-byte string of either 0 (CHR\$(&H00)) or 1 (CHR\$(&HFF)).

background is optional; if omitted, CHR\$(&H00) is used.

PAINT shades the Graphics Screen with tiling starting at the specified X-Y coordinates, proceeding upward and downward.

x,y**Paint Startpoint**

x,y is the coordinate where painting is to begin and must:

- . Be inside the area to be painted.
- . Be on the working area of the Screen.

For example:

```
10 CIRCLE(320,120),80
20 PAINT(320,120),1,1
```

A circle with a centerpoint of (320,120) is drawn and painted in white.

tiling
Paint Style

tiling is the pattern in a graphics display. By specifying each pixel, you can produce a multitude of tiling styles thereby simulating different shades of paint on the Screen.

tiling is convenient to use in bar graphs, pie charts, etc., or whenever you want to shade with a defined pattern.

There are two types of tiling:

- . Numeric expressions
- . Strings

Numeric Expressions. There are only two numeric expressions that can be used for the paint style -- 0 and 1. 1 paints all pixels ON (solid white) and 0 paints all pixels OFF (solid black).

To use numeric expressions, enter either a 0 or 1. For example:

```
PAINT (320,120),1,1
```

Strings (Point-by-Point Painting). You can paint precise patterns using strings by defining a multi-pixel grid, pixel-by-pixel, on your Screen as one contiguous pattern.

String-painting is called "pixel" painting because you are literally painting the Screen "pixel-by-pixel" in a predetermined order.

You can define tile length as being one to 64 vertical tiles, depending on how long you want your pattern. Tile width, however, is always eight horizontal pixels (8 pixels representing" one 8-bit byte). The dimensions of a tile pattern are length x width. Tile patterns are repeated as necessary to paint to the specified borders. Because of its symmetry, you'll probably find equilateral pixel grids most convenient.

Figure 14. Example of an 8-by-8 Pixel Grid

Strings allow numerous graphic variations because of the many pixel combinations you can define.

Important Note: You cannot use more than two consecutive rows of tile which match the background or an Illegal Function Call error will occur. For example:

```
PAINT (1,1),CHR$(&HFF)+CHR$(&HFF)+CHR$(&H00)+CHR$(&H00)  
+CHR$(&H00)+CHR$(&H00),1,CHR$(&H00)
```

returns a Function Call error.

Using Tiling

You may want to use a sheet of graph paper to draw a style pattern. This way, you'll be able to visualize the pattern and calculate the binary and hexadecimal numbers needed.

Note: Tiling should only be done on either a totally black or totally white background; otherwise, results are unpredictable.

To draw an example of a tile on paper:

1. Take a sheet of paper and draw a grid according to the size you want (8 x 8, 24 x 8, etc.). Each boxed area on this grid, hypothetically, represents one pixel on your Screen.
2. Decide what type of pattern you want (zigzag, diagonal lines, perpendicular lines, etc.)
3. Fill in each grid in each 8-pixel-wide row of the tile if you want that pixel to be ON, according to your

pattern. If you want the pixel to be OFF, leave the grid representing the pixel blank.

4. On your paper grid, count each ON pixel as 1 and each OFF pixel as 0. List the binary numbers for each row to the side of the grid. For example, you might have 0001 1000 on the first row, 0111 0011 on the second row, etc.
5. Using a hexadecimal conversion chart, convert the binary numbers to two-digit hexadecimal numbers. (Each row equates to a two-digit hexadecimal number.)
6. Insert the hexadecimal numbers in a tile string and enter the string in your program.

(Note: For a listing of commonly used tiling styles, see Appendix F.)

Example

For example, if you're working on an 8 x 8 grid and want to draw a plus ("+") sign:

8 x 8 grid								Binary Hexadecimal		
Ø	Ø	Ø	1	1	Ø	Ø	Ø	ØØØ1	1ØØØ	18
Ø	Ø	Ø	1	1	Ø	Ø	Ø	ØØØ1	1ØØØ	18
Ø	Ø	Ø	1	1	Ø	Ø	Ø	ØØØ1	1ØØØ	18
1	1	1	1	1	1	1	1	1111	1111	FF
1	1	1	1	1	1	1	1	1111	1111	FF
Ø	Ø	Ø	1	1	Ø	Ø	Ø	ØØØ1	1ØØØ	18
Ø	Ø	Ø	1	1	Ø	Ø	Ø	ØØØ1	1ØØØ	18
Ø	Ø	Ø	1	1	Ø	Ø	Ø	ØØØ1	1ØØØ	18

Figure 15

Tile string:

```
A$=CHR$(&H18)+CHR$(&H18)+CHR$(&H18)+CHR$(&HFF)+CHR$(&HFF)
  +CHR$(&H18)+CHR$(&H18)+CHR$(&H18)
```

b**Border**

Border is the OFF/ON color of the border of a graphics design where painting is to stop and is a numeric expression of either Ø or 1. If omitted, 1 (ON) is used and all the pixels on the border are set (solid white).

background**Background Area**

Background is a 1-byte character which describes the background of the area you are painting. CHR\$(&HØØ) specifies a black background and CHR\$(&HFF) is a totally white background. If background is not specified, BASICG uses CHR\$(&HØØ).

Painting continues until a border is reached or until PAINT does not alter the state of any pixels in a row. However, if

TRS-80[®]

pixels in a given row are not altered and the tile that was to be painted in that row matches the background tile, painting will continue on to the next row.

Note: BASICG uses Free Memory for tiling.

Examples

```
10 CIRCLE (300,100),100
20 PAINT (300,100),1,1
```

Paints the circle in solid white.

```
10 CIRCLE (100,100),300
20 PAINT (100,100),1,1
```

Paints the circle. Only the visible portion of the circle is painted on the Screen.

```
5 A=1
10 CIRCLE (320,120),100
20 CIRCLE (100,100),50
30 CIRCLE (400,200),60
40 CIRCLE (500,70),50
50 PAINT (320,120),A,1
60 PAINT (100,100),A,1
70 PAINT (400,200),A,1
80 PAINT (500,70),A,1
```

The tiling style is assigned the value 1 in line 5 (A=1) for all PAINT statements. Four circles are drawn and painted in solid white.

```
10 LINE (140,80)-(500,200),1,B
20 PAINT (260,120),CHR$(&HEE)+CHR$(&H77)+CHR$(00),1
```

Paints box in specified tiling style using strings.

```
10 CIRCLE (300,100),100
20 PAINT (300,100),"D",1
```

This example uses a character constant to paints the circle in vertical black and white stripes. The character "D" (0100

Ø1ØØ) sets this vertical pattern: one vertical row of pixels ON, three rows OFF.

```
1Ø CIRCLE (32Ø,12Ø),2ØØ
2Ø PAINT (32Ø,12Ø),"332211",1
3Ø PAINT (1ØØ,7Ø),"EFEF",1
```

This example draws and paints a circle, then paints the area surrounding the circle with a different paint style (line 3Ø). This PAINT statement's (line 3Ø) startpoint must be outside the border of the circle.

```
1Ø PAINT (32Ø,12Ø),CHR$(&HFF),1
2Ø CIRCLE (32Ø,12Ø),1ØØ,Ø
3Ø PAINT (32Ø,12Ø),CHR$(Ø)+CHR$(&HFF),Ø,CHR$(&HFF)
```

Paints Screen white, draws circle and paints circle with a pattern.

```
1Ø PAINT (32Ø,12Ø),CHR$(&HFF),1
2Ø CIRCLE (32Ø,12Ø),1ØØ,Ø
3Ø PAINT (32Ø,12Ø),CHR$(Ø)+CHR$(&HAA),Ø,CHR$(&HFF)
```

Paints the Screen white, draws a circle and paints the circle with a pattern.

```
1Ø CIRCLE(3ØØ,1ØØ),1ØØ
2Ø A$=CHR$(&HØØ)+CHR$(&H7E)+CHR$(&H18)+CHR$(&H18)+CHR$(&H18)
+CHR$(&H18)+CHR$(&H18)+CHR$(&HØØ)
3Ø PAINT(3ØØ,1ØØ),A$,1
```

This draws the circle and paints with the letter T within the parameters of the circle.

```
1Ø A$=CHR$(&H41)+CHR$(&H22)+CHR$(&H14)+CHR$(&HØ8)+CHR$(&H14)
+CHR$(&H22)+CHR$(&H41)+CHR$(&HØØ)
2Ø PAINT (3ØØ,1ØØ),A$, 1
```

This paints Xs over the entire Screen.

```
1Ø TILE$(Ø)=CHR$(&H22)+CHR$(&HØØ)
2Ø TILE$(1)=CHR$(&HFF)+CHR$(&HØØ)
3Ø TILE$(2)=CHR$(&H99)+CHR$(&H66)
```

TRS-80®

```

40 TILE$(3)=CHR$(&H99)
50 TILE$(4)=CHR$(&HFF)
60 TILE$(5)=CHR$(&HF0)+CHR$(&HF0)+CHR$(&H0F)+CHR$(&H0F)
70 TILE$(6)=CHR$(&H3C)+CHR$(&H3C)+CHR$(&HFF)
80 TILE$(7)=CHR$(&H03)+CHR$(&H0C)+CHR$(&H30)+CHR$(&HC0)
90 A$=TILE$(0)+TILE$(1)+TILE$(2)+TILE$(3)+TILE$(4)+TILE$(5)
  +TILE$(6)+TILE$(7)
100 PAINT(300,100),A$,1

```

This example paints the Screen with a tiling pattern made up of eight individually defined tile strings (0-7).

POINT (function)

Returns Pixel Value

POINT(x,y)

x specifies an X-coordinate and is an integer expression.

y specifies a Y-coordinate and is an integer expression.

values returns with POINT are:

0 (pixel OFF)

1 (pixel ON)

-1 (pixel is off the Screen)

The POINT command lets you read the OFF/ON value of a pixel from the Screen.

Values for POINT that are off the Screen (i.e., PRINT POINT(800,500)) return a -1, signifying the pixel is off the Screen.

Example

```

10 PSET(300,100),1
20 PRINT POINT(300,100)

```

Reads and prints the value of the pixel at the point's coordinates (300,100) and displays its value: 1

```
PRINT POINT(3000,1000)
```

Since the pixel is off the Screen, a -1 is returned.

```
PRINT POINT(-3000,-1000)
```

Since the pixel is off the Screen, a -1 is returned.

```
PSET(200,100),0
PRINT POINT(200,100)
```

Reads and prints the value of the pixel at the point's coordinates (200,100) and displays its value: 0

```
10 PSET(300,100),1
20 IF POINT(300,100)=1 THEN PRINT "GRAPHICS BASIC!"
```

Sets point ON. Since the point's value is 1, line 20 is executed and Graphics BASIC is displayed:

```
GRAPHICS BASIC!
```

```
10 PSET(RND(640),RND(240)),1
20 IF POINT(320,120)=1 THEN STOP
30 GOTO 10
```

Sets points randomly until (320,120) is set.

```
5 CLS2
10 LINE(50,80)-(120,100),1,BF
20 PRINT POINT(100,80)
30 PRINT POINT(110,80)
40 PRINT POINT(115,90)
50 PRINT POINT(50,40)
60 PRINT POINT(130,120)
```

The first three pixels are in the filled box, so 1s are returned for the statements in lines 20, 30, and 40. The pixels specified in lines 50 and 60 are not in the shaded box and 0s are returned.

PRESET

Sets Pixel OFF (or ON)

PRESET(x,y),switchx specifies an X-coordinate and is an integer expression.y specifies an Y-coordinate and is an integer expression.switch specifies a pixel's OFF/ON code and is an integer of either 0 (OFF) or 1 (ON).switch is optional; if omitted, 0 (OFF) is used.

PRESET sets a pixel either OFF (0) or ON (1), depending on switch. If switch is not specified, 0 (OFF) is used.

Values for (x,y) that are larger than the parameters of the Screen (i.e., greater than 639 for x and 239 for y) are accepted, but these points are off the Screen and therefore are not PRESET.

Note: The only choice for switch is 0 or 1. If you enter any other number, a Function Call error will result.

Examples

```
10 PRESET (50,50),1
20 PRESET (50,50),0
```

Turns ON the pixel located at the specified coordinates (in line 10) and turns the pixel OFF (in line 20).

```
10 PRESET (320,120),1
20 PRESET (300,100),1
30 PRESET (340,140),1
40 FOR I=1 TO 1000: NEXT I
50 PRESET (320,120)
60 PRESET (300,100)
70 PRESET (340,140)
80 FOR I=1 TO 1000: NEXT I
```

Sets the three specified pixels ON (through the three PRESET statements), pauses, and then turns the three pixels OFF.

```
PRESET(3000,1000),1
```

The values for (x,y) are accepted, but since the coordinates are beyond the parameters of the Screen, the point is not PRESET.

PSET

Sets Pixel ON (or OFF)

PSET(x,y),switch

x specifies an X-coordinate and is an integer expression.

y specifies a Y-coordinate and is an integer expression.

switch specifies a pixel's OFF/ON color code and is a numeric expression of 0 (OFF) or 1 (ON).

switch is optional; if omitted, 1 (ON) is used.

PSET sets a pixel either OFF (0) or ON (1), depending on switch. If switch is not specified, 1 (ON) is used.

The only choice for switch with PSET is 0 and 1. If you enter any other number, an Illegal Function Call will occur.

Values for (x,y) that are larger than the parameters of the Screen (i.e., greater than 639 for x and 239 for y) are accepted, but these points are off the Screen and therefore are not PSET.

Examples

```
10 A=1
20 PSET (50,50),A
```

Turns the pixel located at the specified coordinates ON.

```
10 PSET (RND(640),RND(240)),1
20 GOTO 10
```

Pixels are randomly set to 1 (ON) over the defined area (the entire Screen).

```
PSET(-300,-200),1
```

The values for (x,y) are accepted, but since it is beyond the parameters of the Screen, the pixel is not set.

```
10 PSET (320,120),1
20 A$=INKEY$: IF A$= "" THEN 20
30 PSET(320,120),0
```

Line 10 sets ("turns ON") a pixel; line 30 resets ("turns OFF") the same dot.

PUT

Puts Rectangular Pixel Area from Array onto Screen

PUT(x1,y1),array name,action

(x1,y1) are coordinates of the upper-left corner of the rectangular pixel area which is to contain a graphic display. x1 is a numeric expression from 0 to 639 and y1 is a numeric expression from 0 to 239.

array name is the name of an array (previously specified by GET) that contains the data to be written into the rectangular pixel area.

action determines how the data is written into the rectangular pixel area and is one of the following:

- PSET** Sets or resets each point in the specified pixel area to the value in the specified array.
- PRESET** Sets or resets each point in the specified pixel area to the inverse of the value in the specified array.
- XOR** Performs a logical exclusive-OR between the bits in the specified array and the pixels in the destination area and displays the result.
- OR** Performs a logical OR between the bits in the specified array and the pixels in the destination area and displays the result.
- AND** Performs a logical AND between the bits in the specified array and the pixels in the destination area and displays the result.

action is optional; if omitted, XOR is used.

Important Note: BASICG recognizes two syntaxes of the command PUT -- the syntax described in this manual and the syntax described in the Model II Owner's Manual. BASIC recognizes only the PUT syntax described in the Model II Owner's Manual.

The PUT function puts a rectangular pixel area stored in an array, and defined by GET, onto the Screen. GET and PUT work jointly. Together, they allow you to "get" a rectangular

pixel area which contains a graphic display, store it in an array, then "put" the array back on the Screen later.

Remember that before you GET or PUT, you have to create an array to store the bit contents of the display rectangular pixel area. The size of the array must match that of the display rectangular pixel area.

PUT moves your GET rectangular pixel area to the startpoint in your PUT statement and the startpoint is the new upper-left corner of the rectangular pixel area.

For example:

```
5 DIM V(3)
10 GET (2,3)-(7,7),V
100 PUT (50,50),V,PSET
```

After GET-ting, PUT this rectangular pixel area to (50,50). The new coordinates are:

```
(50,50) (51,50) (52,50) (53,50) (54,50) (55,50)
(50,51) (51,51) (52,51) (53,51) (54,51) (55,51)
(50,52) (51,52) (52,52) (53,52) (54,52) (55,52)
(50,53) (51,53) (52,53) (53,53) (54,53) (55,53)
(50,54) (51,54) (52,54) (53,54) (54,54) (55,54)
```

The rectangular pixel area ((50,50)-(55,54)) is exactly the same pixel size as (2,3)-(7,7); only the location is different.

Figure 16

With PUT, action can be PSET, PRESET, OR, AND, or XOR.

These operators are used in Graphics BASIC to test the true/false ("OFF/ON" or 0/1) conditions of a pixel in the original pixel area and the destination pixel area.

For example (using PSET), the pixel is set ON only if the bit in the PUT array is set ON. If the bit is OFF, the pixel is turned OFF (reset).

With PRESET, the pixel is set ON only if the bit in the PUT array is set OFF. If the bit is ON, the pixel is turned OFF (reset).

Using OR, the pixel is set ON if the bit in the PUT array is ON or the corresponding pixel in the destination area is ON. In all other cases, the pixel is turned OFF (reset). In other words:

OR	OFF	ON
OFF	OFF	ON
ON	ON	ON

With AND, the pixel is set ON if both the bit in the PUT array and the corresponding pixel in the destination area are ON. In all other cases, the pixel is turned OFF (reset). In other words:

TRS-80[®]

AND	OFF	ON
OFF	OFF	OFF
ON	OFF	ON

Using XOR, the pixel is set ON if either the bit in the PUT array or the corresponding pixel in the destination area (but not both) is ON. In all other cases, the pixel is turned OFF (reset). In other words:

XOR	OFF	ON
OFF	OFF	ON
ON	ON	OFF

The following BASICG program will graphically illustrate the differences between the various action options. Since the program will give you a "hard-copy" printout of the action options, you'll need to connect your TRS-80 to a graphic printer such as the Line Printer VII or VIII. See the section of this manual entitled Graphic Utilities for more details on using the Graphics package with a printer.

```

10 DATA "OR","AND","PRESET","PSET","XOR"
20 CLS 2
30 FOR Y = 10 TO 210 STEP 50
40 FOR X = 0 TO 400 STEP 200

270 SYSTEM "VDOGRPH"
280 SYSTEM "GPRINT"

```

Figure 17

Hints and Tips about PUT:

An Illegal Function Call error will result if you attempt to PUT a rectangular pixel area to a section of the Screen which is totally or partially beyond the parameters of the Screen. For example:

```

GET(50,50)-(150,150),V
PUT(200,200),V,PSET

```

returns an error because the rectangular pixel area cannot be physically moved to the specified rectangular pixel area (i.e., (200,200)-(300,300)).

If you use PUT with a viewport (see VIEW), all coordinates must be within the parameters of the viewport or you'll get an Illegal Function Call error.

Examples

PUT with PSET

```

10 DIM V%(63)
20 CIRCLE (30,30),10
30 GET (10,10)-(40,40),V%
40 FOR I=1 TO 500: NEXT I
50 CLS 1
60 PUT (110,110),V%,PSET
70 FOR I=1 TO 500: NEXT I

```

In this example, the circle is drawn, stored, moved and re-created. First the white-bordered circle appears in the upper left corner of the Screen (position (30,30) -- program line 20). After a couple of seconds (because of the delay statement), it disappears and then reappears on the Screen -- (110,110) -- program line 50.

What specifically happened is:

1. An array was created (line 10).
2. A circle was drawn (line 20).
3. GET -- The circle which was within the source rectangular pixel area, as specified in the GET statement's parameters is stored in the array (line 30).
4. The Screen is cleared (line 50).
5. PUT -- The circle from the array was PUT into the destination rectangular pixel area as specified in the PUT statement (line 60) with the PSET option.

```

10 FOR X=1 TO 5
20 FOR Y=1 TO 3
30 PSET (100+X, 100+Y)
40 NEXT Y: NEXT X
50 A$=INKEY$: IF A$="" THEN 50
60 DIM V%(5)
70 GET (100,100)-(106,104),V%
80 FOR A=10 TO 100 STEP 10
90 FOR B=10 TO 100 STEP 10
100 PUT (A,B),V%,PSET
110 A$=INKEY$: IF A$="" THEN 110
120 NEXT B: NEXT A

```

```

10 DIM V%(700)
20 LINE (20,20)-(20,80)
30 LINE (80,0)-(80,80)
40 LINE (30,30)-(30,80)
50 LINE (10,5)-(10,80)
60 GET (0,0)-(100,100),V%
70 FOR I=1 TO 1000: NEXT I
80 PUT (180,120),V%,PSET
90 FOR I=1 TO 1000: NEXT I

```

Draws four lines. GET stores the lines in the rectangular pixel area. PUT moves the lines to another rectangular pixel area.

SCREEN

Sets Screen/Graphics Speed

SCREEN type

type specifies which "Screen" to use and is a numeric expression from 0 to 3.

0 = Graphics ON/ normal speed

1 = Graphics OFF/normal speed

2 = Graphics ON/ high speed

3 = Graphics OFF/high speed

SCREEN lets you set the proper Screen and Screen speed. SCREEN 2 and 3 produce graphics more rapidly than SCREEN 0 and 1. Any value greater than 3 with SCREEN gives an error.

SCREEN is convenient to use when you want to display either a Graphics Screen or a Text Screen. For example, you may have run a program and then add to it. With SCREEN, you can remove the graphics display, add to the program, and then return to the Graphics Screen.

Graphics can produce a "flashing" on the Screen if the high speed option is specified. With normal speed graphic presentations, however, this flashing will not occur.

Examples

```
10 SCREEN 3
20 LINE (150,150)-(200,200)
```

The Computer executes the short program but the Graphics Screen cannot display the graphics because of the SCREEN 3 command. To display the line, type: SCREEN 0 <ENTER>

```
10 CLS
20 SCREEN 3
30 LINE(10,10)-(255,191)
40 LINE(0,191)-(255,0)
```

TRS-80[®]

```
50 A$=INKEY$: IF A$="" THEN 50
60 SCREEN 0
70 A$=INKEY$: IF A$="" THEN 70
80 GOTO 10
```

The Computer executes the program (draws two intersecting lines) but the Screen cannot display the graphics because of SCREEN 3. By pressing any key, the graphics are displayed because of SCREEN 0.

```
10 CIRCLE (200,100),100
20 PAINT (200,100),"44",1
```

Now run the program and type:

```
SCREEN 3 <ENTER>
```

This command turns the Graphics Screen OFF. Type:

```
SCREEN 0 <ENTER>
```

This command turns the Graphics Screen back ON. By entering the SCREEN 3 and SCREEN 0 commands, you can alternately turn the Graphics Screen ON and OFF without losing the executed program display.

VIEW (command)

Redefines the Screen (Creates a Viewport)

VIEW (x1,y1)-(x2,y2), c, b

(x1,y1) are coordinates of the upper-left corner of a rectangular viewport area. x1 is an integer expression between 0 and 639. y1 is an integer expression between 0 and 239.

(x2,y2) are coordinates of the lower-right corner of a rectangular viewport area. x2 is an integer expression \geq to x1 and \leq 639.

y2 is an integer expression \geq y1 and \leq 239.

c specifies the color of the interior of the viewport and is an integer expression of either 0 or 1. c is optional; if omitted, the viewport is not shaded.

b specifies the border color of the viewport and is an numeric expression of either 0 or 1. b is optional; if omitted, a border is not drawn.

VIEW creates a "viewport" which redefines the Screen parameters (0-639 for X and 0-239 for Y). This defined area then becomes the only place you can draw graphics displays.

If you enter more than one viewport, you can only draw displays in the last-defined viewport.

Since VIEW redefines the SCREEN:

- . CLS 1 clears the interior of the viewport only.
- . If you PSET or PRESET points, draw circles, etc., beyond the parameters of the currently defined viewport, only the portions that are in the viewport will be displayed.
- . If you try to read a point beyond the viewport (with POINT), it will return a -1.
- . You can only GET and PUT arrays within the viewport.
- . You can't PAINT outside the viewport.

The upper-left corner of viewport is read as (0,0) (the "relative origin") when creating items inside the viewport. All the other coordinates are read relative to this origin. However, the "absolute coordinates" of the viewport, as they are actually defined on the Graphics Cartesian system, are retained in memory and can be read using VIEW as a function.

Every viewport has absolute and relative coordinates and graphic displays are drawn inside using those coordinates. For example:

```
10 VIEW (100,100)-(200,200),0,1
20 LINE (30,15)-(80,60),1
```

Figure 18

Note: After each of the following examples, you'll have to redefine the entire Screen to VIEW(0,0)-(639,239) before performing any other Graphics functions.

Examples

```
VIEW (100,100)-(200,200),0,1
```

Draws a black viewport (pixels OFF) that is outlined in white (border pixels ON).

```
VIEW (100,100)-(200,200),1,1
```

Draws a white viewport (pixels ON) that is outlined in white (border pixels ON).

```
VIEW (50,50)-(100,100),1,0
```

Draws a white viewport (pixels ON) that is outlined in black (border pixels OFF).

```

10 VIEW (10,10)-(600,200),0,1
20 VIEW (50,50)-(100,100),0,1
30 LINE(RND(500),RND(190))-(RND(500),RND(190))
40 GOTO 30

```

First you defined a large viewport that almost covered the entire Screen. Next you defined a smaller viewport. The Random command draws lines within the specified parameters but only the segments of the lines that are within the parameters of the smaller viewport are visible since it was specified last.

```

10 VIEW(80,80)-(400,200),0,1
20 VIEW(100,90)-(300,170),0,1
30 VIEW(120,100)-(200,200),0,1
40 VIEW(50,50)-(100,100),0,1

```

Draws four viewports. All further drawing takes place in the last viewport specified.

```

10 VIEW(210,80)-(420,160),0,1
20 CIRCLE(300,120),180,1
30 LINE(15,15)-(60,60),1
40 CIRCLE(90,40),50,1
50 LINE(40,30)-(500,30),1

```

Draws a viewport. Draws a circle but only a portion is within the parameters of the viewport. This circle's centerpoint is relative to the upper left corner of the viewport and not to the absolute coordinates of the graphics Cartesian system. A line is drawn which is totally within the parameters of the viewport. Another circle is drawn which is totally within the parameters of the viewport. Another line is drawn which is only partially within the parameters of the viewport.

```

10 VIEW (190,70)-(440,180),0,1
20 CIRCLE (300,140),170,1
30 CIRCLE (100,230),400,1
40 LINE (10,10)-(500,230),1

```

Draws a viewport. A circle is drawn but only a portion is within the parameters of the viewport. Another circle is drawn and a larger portion is within the parameters of the

viewport. A line is drawn but only a segment is within the parameters of the viewport.

VIEW (function)

Returns Viewport Coordinates

VIEW(p)

(p) specifies a coordinate on the X- or Y-axes and is a integer expression between 0-3: 0 returns the left X-coordinate of your viewport. 1 returns the upper Y-coordinate. 2 returns the right X-coordinate. 3 returns the lower Y-coordinate.

VIEW returns a corner coordinate of a viewport. It is important to note the parentheses are not optional. If you enter the VIEW function without the parentheses, a Syntax Error will result.

To display one of the four viewport coordinates, you must enter one of the following values for p:

- . 0 returns the left X-coordinate
- . 1 returns the left Y-coordinate
- . 2 returns the right X-coordinate
- . 3 returns the right Y-coordinate

Important Note: When you have defined several viewports, VIEW only returns the coordinates of the last-defined viewport.

Examples

Set up the following viewport:

```
VIEW(100,80)-(220,150),0,1
```

Now type: PRINT VIEW(0) <ENTER>

Displays: 100

Type: PRINT VIEW(1) <ENTER>

Displays: 80

Enter: PRINT VIEW(2) <ENTER>

Displays: 22Ø

Type: PRINT VIEW(3) <ENTER>

Displays: 15Ø

Set up the following viewports:

VIEW(1ØØ,8Ø)-(22Ø,15Ø),Ø,1 <ENTER>

VIEW(25Ø,17Ø)-(35Ø,22Ø),Ø,1 <ENTER>

Now enter: PRINT VIEW(Ø) <ENTER>

Displays: 25Ø

Type: PRINT VIEW(1) <ENTER>

Displays: 17Ø

Now type: PRINT VIEW(2) <ENTER>

Displays: 35Ø

Type: PRINT VIEW(3) <ENTER>

Displays: 22Ø

Returns coordinates of last-defined viewport.

3/ Graphics Utilities

There are seven utilities included with the TRS-80 Computer Graphics package which are intended to be used as stand-alone programs. However, if you are an experienced programmer, you can use these with BASICG, Assembly, FORTRAN, and COBOL. The source-code for each utility, that illustrate Graphics programming techniques, is listed later in this section.

The Graphics Utilities let you:

- . Save graphic displays to diskette.
- . Load graphic displays from diskette.
- . Transfer Text Screen displays (video memory) to graphics memory.
- . Print graphic displays on a graphics printer.
- . Turn graphics display OFF or ON.
- . Clear graphics memory.

To use these utilities from BASICG, use the SYSTEM command followed by the name of the utility in quotation marks (e.g., SYSTEM "GCLS" <ENTER>) and control returns to your BASICG program. From TRSDOS, enter the utility directly, without quotation marks (e.g., GCLS <ENTER>).

To use these utilities from an assembly-language program, use the supervisor call DOSCMD (function code 37) or RETCMD (function code 38) to send a command to TRSDOS. Control returns to your program if you use RETCMD.

To call these routines from FORTRAN, see the Subprogram Linkage section of your TRS-80 Model II FORTRAN Manual (26-4701).

To call these routines from COBOL, refer to the COBOL section of this manual.

Note: These utilities load into high memory starting at F000 (hex); therefore, they cannot be used with SPOOL, DEBUG, HOST, DO, or any communication drivers that use high memory.

=====
Utilities
 =====

Command	Action
GCLS	Clears graphics screen.
GLOAD	Loads graphics memory from diskette.
GPRINT	Lists graphics to printer.
GROFF	Turns Graphic Screen OFF.
GRON	Turns Graphic Screen ON.
GSAVE	Saves graphics memory to diskette.
VDOGRPH	Transfers Text Screen displays to graphics memory.

 =====
Table 6
 =====
GCLS

Clears Graphics Screen

 =====
GCLS
 =====

GCLS clears the Graphics Screen by erasing the contents of graphics memory. GCLS erases graphics memory by writing zeroes (OFF) to every bit in memory. GCLS does not clear the Text Screen (video memory).

Examples

When TRSDOS READY is displayed, type:

GCLS <ENTER>

or when the BASICG Ready prompt (>) is displayed, type:

SYSTEM"GCLS" <ENTER>

or

100 SYSTEM"GCLS"

GLOAD

Loads Graphics Memory from Diskette

GLOAD filename /ext .password :d (diskette name)

filename consists of a letter followed by up to seven optional numbers or letters.

/ext is an optional name-extension; ext is a sequence of up to three numbers or letters.

.password is an optional password; password is a sequence of up to eight numbers or letters.

:d is an optional drive specification; d is one of the digits 0 through 7.

(diskette name) is an optional field of up to eight numbers or letters. If this field is included, it must be preceded by a drive specification.

Note: There cannot be spaces within a file specification. TRSDOS terminates the file specification at the first space.

With GLOAD, you can load TRSDOS files that have graphic contents into graphics memory. These files must have been previously saved to diskette using GSAVE.

Examples

When TRSDOS READY is displayed, type:

```
GLOAD PROGRAM/DAT.PASSWORD:0(GRAPHICS) <ENTER>
```

or when the BASICG Ready prompt (>) is displayed, type:

```
SYSTEM"GLOAD PROGRAM" <ENTER>
```

or

```
100 SYSTEM "GLOAD PROGRAM"
```

GPRINT

Lists Graphic Display to Printer

GPRINT

GPRINT lets you print graphics memory on a graphic (dot-addressable) printer such as Radio Shack's Line Printer VII (26-1167) or VIII (26-1168). However, distortion will occur when Graphic routines are printed on the Line Printer VII and VIII. This is because GPRINT is not a true pixel-by-pixel "Screen Dump" since the pixel size and spacing on the Screen is different from the pixel size and spacing on the Printer. GPRINT is a point of departure for the user to obtain hard-copy representations of graphics.

To print graphic displays, GPRINT turns the contents of the Graphic Screen clockwise 90 degrees and then prints.

However, FORMS must be used to set printing parameters.

Most uses will require that you set FORMS to:

```
FORMS P=66 L=60 W=0 C=0 <ENTER>
```

Then type:

```
FORMS X <ENTER>
```

See your Model II and printer owner's manual for more details on setting printing parameters.

Examples

When TRSDOS READY is displayed, type:

```
GPRINT <ENTER>
```

or when the BASICG Ready prompt (>) is displayed, type:

```
SYSTEM"GPRINT" <ENTER>
```

or

```
100 SYSTEM"GPRINT"
```

For a complete example of using GPRINT, see Appendix D.

GROFF

Turn Graphic Display OFF

GROFF

GROFF turns the Graphics Screen OFF. GROFF is different from GCLS since GROFF simply removes the Graphics display without erasing the contents of graphic memory. GCLS completely clears graphics memory by writing zeroes (OFF) to every bit in memory.

Examples

When TRSDOS READY is displayed, type:

```
GROFF <ENTER>
```

or when the BASICG Ready prompt (>) is displayed, type:

```
SYSTEM "GROFF" <ENTER>
```

or

```
100 SYSTEM "GROFF"
```

GRON

Turn Graphic Display ON

GRON

GRON turns the Graphics Screen ON.

Examples

When TRSDOS READY is displayed, type:

```
GRON <ENTER>
```

or when the BASICG Ready prompt (>) is displayed, type:

```
SYSTEM "GRON" <ENTER>
```

or

100 SYSTEM "GRON"

GSAVE

Saves Graphics Memory to Diskette

GSAVE filename /ext .password :d (diskette name)

filename consists of a letter followed by up to seven optional numbers or letters.

/ext is an optional name-extension; ext is a sequence of up to three numbers or letters.

.password is an optional password; password is a sequence of up to eight numbers or letters.

:d is an optional drive specification; d is one of the digits 0 through 7.

(diskette name) is an optional field of up to eight numbers or letters. If this field is included, it must be preceded by a drive specification.

Note: There cannot be spaces within a file specification. TRSDOS terminates the file specification at the first space.

With GSAVE, the contents in graphics memory is saved under a specified filename which follow the standard TRSDOS format. To load the file back into memory, use GLOAD.

Examples

When TRSDOS READY is displayed, type:

```
GSAVE PROGRAM/DAT.PASSWORD:0(GRAPHICS) <ENTER>
```

or when the BASICG Ready prompt (>) is displayed, type:

```
SYSTEM"GSAVE PROGRAM" <ENTER>
```

or

```
100 SYSTEM "GSAVE PROGRAM"
```

VDOGRPH

Transfer Text Screen to Graphics Memory

VDOGRPH

VDOGRPH transfers the contents of the Text Screen (Video Display) to graphics memory. Before you can save a graphics display where text characters are an integral part of your graphics picture, VDOGRPH should be used. Use VDOGRPH in the last line of your program and, as you run the program, the Video Display will be transferred.

If you do not make the video-to-graphics transfer before you save the graphics memory, the file will contain the Graphics Screen contents only and not the Text Screen contents. As a result, for example, a bar graph which does not have the graph's numeric calibrations would be saved.

Examples

When TRSDOS READY is displayed, type:

```
VDOGRPH
```

or when the BASICG Ready prompt (>) is displayed, type:

```
SYSTEM"VDOGRPH" <ENTER>
```

or

```
1000 SYSTEM"VDOGRPH"
```

For a complete example of using VDOGRPH, see Appendix D, Sample Sessions.

4/ Graphics Subroutine Library (FORTRAN)

The Graphics Subroutine Library included on the Computer Graphics diskette lets you use the functions of TRS-80 Computer Graphics while programming in Model II FORTRAN (26-4701). This library (GRPLIB/REL) must be linked to any FORTRAN program that accesses the Graphics Subroutines.

BASICG vs. the Graphics Subroutine Library

The Graphics Subroutine Library contains subroutines which provide the same capabilities as the Graphics commands and functions in BASICG. The Graphics subroutines have basically the same names and parameters as the BASICG commands. The major differences between the Library subroutines and the BASICG commands are:

- The BASICG command LINE has 3 corresponding library subroutines: LINE, LINEB, and LINEBF. LINEB and LINEBF provide the functions of the BASICG command LINE with the parameters B and BF respectively.
- The BASICG command PAINT has 2 corresponding library subroutines: PAINT and PAINTT. PAINT is for painting solid black or white, and PAINTT is for using tiling.
- The Library subroutines that correspond to BASICG commands that use (x,y) coordinates (except for VIEW) use (x,y) coordinates that have been previously set. The subroutines used to set the coordinates are SETXY and SETXYR.

Setting Points Using SETXY and SETXYR

The coordinates specified by SETXY or SETXYR will be called the "current" and "previous" coordinates. Subroutines that use one (x,y) coordinate pair use the "current" coordinates and subroutines that use two (x,y) pairs use both the "current" and the "previous" coordinates. Each call to SETXY or SETXYR sets the coordinates as follows:

1. Assign the values of the "current" (x,y) coordinates to the "previous" (x,y) coordinates, (discarding the old "previous" coordinates).

2. Assign new values for the "current" (x,y) coordinates as specified by the arguments supplied. SETXY simply sets the "current" coordinates to the values of its arguments. SETXYR adds the values of its arguments to the "current" coordinates to obtain the new coordinates.

Initialization

Before any calls are made to Graphics, the Graphics library and board must be initialized. A special initialization routine (GRPINI) is included in the library. A call to GRPINI must be made as the first access to the Graphics library.

Example

```

00100 C          SAMPLE INITIALIZATION
00150           DIMENSION V(30,30)
00200           CALL GRPINI(0)

```

Linking

The Library (GRPLIB/REL) must be linked to any programs that access the Graphics Subroutines. You must use the linker (L80) to generate the load module.

Example

```

L80 <ENTER>
*SAMPLE:1-N
*GRPHSAM,GRPLIB-S,FORLIB-S,-U
*-E

```

This example links both the Graphics Library and the FORTRAN Subroutine Library to the relocatable file GRPHSAM/REL. In this example, *SAMPLE:1-N is the file name, drive specification, and switch respectively and *GRPHSAM,GRPLIB-S,FORLIB-S,-U is the program name. *-E sends the routine.

Note: If there are unresolved external references, then the FORTRAN Library may need to be scanned a second time.

Errors

If you enter incorrect parameters for any of the Graphics Subroutines, your Screen will display:

GRAPHICS ERROR

and return program control to TRSDOS READY. This is the only error message you'll get when executing the Subroutines.

Important Note: Free memory is utilized by the Graphic Routine for temporary storage. Extreme care should be exercised if your program accesses this memory.

Routines/Functions

Most of the FORTRAN Subroutines and functions described in this section have a corresponding command in the Graphics BASIC Language Reference section of this manual.

TRS-80®

Routine	Action
CIRCLE	Draws a circle, arc, semi-circle, or ellipse.
CLS	Clears Screen(s).
GET	Reads contents of a rectangular pixel area into an array.
GRPINI	Graphics initialization routine.
LINE	Draws a line.
LINEB	Draws a box.
LINEBF	Draws a filled box.
PAINT	Paints Screen in specified OFF/ON color.
PAINTT	Paints Screen in a specified pattern.
PRESET	Sets pixel OFF/ON.
PSET	Sets pixel OFF/ON.
PUT	Puts stored array on Screen.
SCREEN	Selects Screen/graphics display speed.
SETXY	Sets (x,y) coordinates (absolute).
SETXYR	Sets (x,y) coordinates (relative).
VIEW	Sets up viewport where graphics is displayed.

Table 7

Function	Action
POINT	Reads pixel value at specified coordinate.
FVIEW	Reads viewport's parameters.

Table 8

Radio Shack®

CIRCLE

Draws a Circle, Arc, Semi-Circle, Point or Ellipse

CIRCLE (radius,color,start,end,ar)

radius is INTEGER type and specifies the radius of the circle.

color is of LOGICAL type, specifies the OFF/ON color of the border of the circle and is a integer expression of either 0 or 1.

start is REAL type and specifies the startpoint of the circle.

end is REAL type and specifies the endpoint of the circle.

ar is the aspect ratio, is REAL type and determines the major axis of the circle. If ar is 0, 0.5 is used.

CIRCLE draws a circle. By varying start, end, and aspect ratio, you can draw arcs, semi-circles, or ellipses using current X- and Y-coordinates as the centerpoint (set by SETXY or SETXYR).

If start and end are 0.0, a circle is drawn starting from the center right side of the circle. Note: In the CIRCLE statement, end is read as 2 x PI even though you have entered 0.0. If you enter 0.0 for aspect ratio, a symmetric circle is drawn.

Example

```
CALL CIRCLE(100,1,0.0,0.0,0.0)
```

Sample Program

This example draws and paints a circle.

```

00010 C   SAMPLE PROGRAM FOR CIRCLE
00020   LOGICAL COLOR,CLGRPH,OPTION
00030   COLOR=1
00040   CLGRPH=1
00050   OPTION=0
00060   CALL GRPINI(OPTION)
00070   CALL CLS(CLGRPH)
00080   CALL SETXY(300,100)
00090   CALL CIRCLE(100,COLOR,0.0,0.0,0.0)
00100   CALL PAINT(COLOR,COLOR)
00110   END

```

CLS

Clears Screen(s)

CLS (n)

n is of LOGICAL type, clears the Screen(s) and is a integer expression between 0 and 2:

- 0 = clears only Text Screen
- 1 = clears only Graphics Screen
- 2 = clears both Text and Graphics

CLS clears Screen(s) according to the specified variable.
 Note: Any value greater than 2 gives you an error.

Example

```
CALL CLS(2)
```

Sample Program (see CIRCLE)

GET

Reads Contents of a Rectangular Pixel Area into an Array

GET (array,size)

array is any type and is the name of the array you specify.

size is INTEGER type and specifies the size of the array in terms of bytes.

GET reads the contents of a rectangular pixel area into an array for future use by PUT. The pixel area is a group of pixels which are defined by the current x and y, and the previous X- and Y-coordinates specified by the SETXY call.

The first two bytes of array are set to the horizontal (X-axis) number of pixels in the pixel area; the second two bytes are set to the vertical (Y-axis) number of pixels in the pixel area. The remainder of array represents the status of each pixel (either ON or OFF) in the pixel area. The data is stored in a row-by-row format. The data is stored eight pixels per byte and each row starts on a byte boundary.

Array Limits

When the array is defined, space is reserved in memory for each element of the array. The size of the array is limited by the amount of memory available for use by your program -- each real number in your storage array uses four memory locations (bytes).

The array must be large enough to hold your graphic display and the rectangular area defined must include all the points you want to store.

To determine the minimum array size:

1. Divide the number of X-axis pixels by 8 and round up to the next highest integer.
2. Multiply the result by the number of Y-axis pixels.

When counting the X-Y axis pixels, be sure to include the first and last pixel.

3. Add four to the total.

4. Divide by four (for real numbers) and two (for integers) rounding up to the next higher integer. (Note: If you're using a LOGICAL array, the result of Step #2 above will produce the desired array size.)

When using arrays, the position and size of the rectangular pixel area is determined by the current and previous (x,y) coordinates.

Position: upper left corner = startpoint = (x1,y1)
 lower left corner = endpoint = (x2,y2)

Size (in pixels): width = x2-x1+1
 length = y2-y1+1

Example

```
CALL GET(A,40000)
```

Sample Program

This example draws a circle, saves the circle into an array, then restores the array to the graphics video.

```

00050 C   SAMPLE FOR GET AND PUT
00100     LOGICAL V(125),ACTION
00150     ACTION=1
00200     CALL GRPINI(0)
00300     CALL CLS(2)
00350 C   DRAW A CIRCLE
00400     CALL SETXY(30,30)
00500     CALL CIRCLE(10,1,0.0,0.0,0.0)
00550 C   SET COORDINATES FOR GET ARRAY
00600     CALL SETXY(10,10)
00700     CALL SETXY(40,40)
00750 C   STORE GRAPHICS INTO ARRAY WITH GET
00800     CALL GET(V,125)
00900     DO 10 I=1,5000
01000 10   CONTINUE
01050 C   CLEAR SCREEN AND RESTORE GRPH FROM ARRAY
01100     CALL CLS(1)
01200     CALL SETXY(110,110)
01300     CALL PUT(V,ACTION)
01400     DO 20 I=1,5000
01500 20   CONTINUE
01600     END

```

GRPINI

Graphics Initialization Routine

GRPINI(option)

option is of LOGICAL type; 0 clears the Graphics Screen, non-zero does not clear the Graphics Screen.

GRPINI is the graphics initialization routine. This function must be called before any other graphics calls are made in FORTRAN.

Example

```
CALL GRPINI(1)
```

Sample Program (see CIRCLE)

LINE

Draws Line

LINE (color, style)

color is of LOGICAL type, specifies the OFF/ON color of a line and is an integer expression of either 0 (OFF, black) or 1 (ON, white).

style is INTEGER type specifies the pattern of the line and is a number in the integer range. -1 indicates a solid line.

LINE draws a line between the previous and current coordinates. These coordinates are set by the SETXY or SETXYR subroutines.

Example

```
CALL LINE (1,-1)
```

Sample Program

This example draws a diagonal line connected to a box, which is connected to a filled box.

```

00010      C   SAMPLE FOR LINE LINEB LINEBF
00020      LOGICAL COLOR
00030      COLOR=1
00040      CALL GRPINI(0)
00050      CALL CLS(2)
00060      CALL SETXY(1,1)
00070      CALL SETXY(210,80)
00080      CALL LINE(COLOR,-1)
00090      CALL SETXY(420,160)
00100      C   COORDINATES ARE NOW (210,80) (420,160)
00110      CALL LINEB(COLOR,-1)
00120      CALL SETXY(639,239)
00130      C   COORDINATES ARE NOW (420,160) (639,239)
00140      CALL LINEBF(COLOR)
00150      END

```

LINEB

Draws Box

LINEB (color, style)

color is of LOGICAL type, specifies the OFF/ON color of a line and is a integer expression of either 0 (OFF, black) or 1 (ON, white).

style is INTEGER type and specifies the pattern of the line. -1 indicates a solid line.

LINEB is the same as LINE except LINEB draws a box between the two sets of coordinates set by the SETXY or SETXYR subroutines.

Example

```
CALL LINEB (1,-1)
```

Sample Program (see LINE)

LINEBF

Draws Painted Box

LINEBF (color)

color is of LOGICAL type, specifies the OFF/ON color of a line and is an integer expression of either 0 (OFF, black) or 1 (ON, white).

LINEBF is the same as LINEB except LINEBF fills the box (colors in the box) and the argument style is not used.

Example

```
CALL LINEBF (1)
```

Sample Program (see LINE)

PAINT

Paints Screen in Specified Color

PAINT (color, border)

color is of LOGICAL type, specifies the OFF/ON color of painting and is an integer expression of either 0 (OFF, black) or 1 (ON, white).

border is of LOGICAL type, specifies the OFF/ON color of the border and is an integer expression of either 0 (OFF, black) or 1 (ON, white).

PAINT paints the Screen in the specified OFF/ON color (black or white). It uses the current X- and Y-coordinates (see SETXY) as its startpoint.

Example

```
CALL PAINT(1,1)
```

Sample Program (see CIRCLE)

PAINTT

Paints Screen in Specified Pattern

PAINTT (arrayT, border, arrayS)

arrayT is a byte array which defines a multi-pixel pattern to be used when painting (tiling). The first byte of arrayT indicates the length of the "tile" (number of bytes).

border is of LOGICAL type and specifies the color of the border. border is an integer expression of either 0 (black) or 1 (white).

arrayS is a byte array that is used to define the background. The first byte is always set to 1; the second byte describes the background you are painting on (X'FF' = white, X'00' = black).

PAINTT lets you paint a precisely defined pattern using a graphics technique called "tiling." You can paint by tiling by defining a multi-pixel grid in an array and then using that array as the paint pattern.

Example

```
CALL PAINTT (A,1,V)
```

Sample Program

```

00100      C   EXAMPLE FOR PAINT WITH TILE
00150      LOGICAL A,B,BORDER
00200      DIMENSION A(9)
00300      DIMENSION B(2)
00350      C   DEFINE TILE ARRAY HERE
00400      DATA A(1), A(2), A(3) / 8, X'81', X'42' /
00500      DATA A(4), A(5), A(6) / X'24', X'18', X'18' /
00600      DATA A(7), A(8), A(9) / X'24', X'42', X'81' /
00650      C   DEFINE BACKGROUND ARRAY HERE
00700      DATA B(1), B(2) / 1, 0 /
00800      CALL GRPINI(0)
00900      CALL CLS(2)
01000      CALL SETXY(300, 100)
01100      CALL CIRCLE(150, 1, 0.0, 0.0, 0.0)
01200      BORDER=1
01300      CALL PAINTT(A, BORDER, B)
01400      END

```

PRESET

Sets Pixel ON/OFF

PRESET (color)

color is of LOGICAL type, specifies whether a pixel is to be set ON or OFF and is an integer expression of either 0 (OFF) or 1 (ON).

PRESET sets the pixel defined by the current (x,y) coordinates either ON or OFF.

Example

```
CALL PRESET(0)
```

Sample Program

```

00100 C PRESET EXAMPLE
00200 LOGICAL COLOR
00300 COLOR=1
00400 CALL GRPINI(0)
00500 CALL CLS(2)
00600 C SET PIXEL TO ON
00600 CALL SETXY(300,120)
00800 CALL PRESET(COLOR)
00900 C TEST PIXEL WHETHER ON OR OFF
01000 K=POINT(M)
01100 30 WRITE (3,35)K
01200 35 FORMAT ('2','PIXEL VALUE IS',I4)
01300 END

```

PSET

Sets Pixel ON/OFF

PSET (color)

color is of LOGICAL type, specifies whether a pixel is to be set ON or OFF and is an integer expression of either 0 (OFF) or 1 (ON).

PSET sets the pixel defined by the current (x,y) coordinates either ON or OFF.

Example

```
CALL PSET(0)
```

Sample Program

```

001000      C   PSET EXAMPLE
002000      LOGICAL COLOR
003000      LOGICAL POINT
004000      COLOR=1
005000      CALL GRPINI(0)
006000      CALL CLS(2)
007000      C   SET PIXEL TO ON
008000      CALL SETXY(300,120)
009000      CALL PSET(COLOR)
010000      C   TEST PIXEL WHETHER ON OR OFF
011000      K=POINT(M)
012000      WRITE (3,35)K
013000      35  FORMAT ('2','PIXEL VALUE IS',I4)
014000      END

```

PUT

Puts Stored Array onto Screen

PUT (array, action)

array is usually LOGICAL type, although any type is permissible. Specifies the array (stored with GET) to be restored.

action is LOGICAL type and specifies how the data is to be written to the video. Action may be one of the following:

1 = OR	3 = PRESET
2 = AND	4 = PSET
	5 = XOR

PUT takes a rectangular pixel area that has been stored by GET and puts it on the screen at current x and y coordinates set by calling SETXY.

Example

```
CALL PUT (V,1)
```

Sample Program (see GET)

SCREEN

Sets Screen

SCREEN (switch)

switch is of LOGICAL type and specifies the type of Screen display and may be one of the following:

- Ø = Graphics ON/ normal speed
- 1 = Graphics OFF/normal speed
- 2 = Graphics ON/ high speed
- 3 = Graphics OFF/high speed

SCREEN lets you set the proper Screen and screen speed. SCREEN 2 and 3 display graphics more rapidly on your Screen than SCREEN Ø and 1. Any value greater than 3 with SCREEN gives you a error.

Example

```
CALL SCREEN(2)
```

Sample Program

This example turns off the graphics display, draws a circle, then turns on the graphics display. The circle is then visible.

```

ØØØ1Ø      C      EXAMPLE FOR SCREEN
ØØØ2Ø      LOGICAL CMD
ØØØ4Ø      CMD=1
ØØØ5Ø      CALL GRPINI(Ø)
ØØØ6Ø      CALL CLS(2)
ØØØ7Ø      CALL SCREEN(CMD)
ØØØ8Ø      CALL SETXY(3ØØ,12Ø)
ØØØ9Ø      CALL CIRCLE(1ØØ,1,Ø.Ø,Ø.Ø,Ø.Ø)
ØØ1ØØ      CALL PAINT(1,1)
ØØ11Ø      DO 2Ø I=1,1ØØØØ
ØØ12Ø      2Ø     CONTINUE
ØØ13Ø      CMD=2
ØØ14Ø      ALL SCREEN(CMD)
ØØ15Ø      END

```

SETXY

Sets Coordinates

SETXY(x,y)

(x,y) are INTEGER type and represent coordinates on the Graphics Screen.

SETXY sets and holds both current and previous X- and Y-coordinates. When a new coordinate is given, it is designated as the "current coordinate" and the last coordinate is designated as the "previous coordinate." If a new coordinate is specified, the "previous coordinate" is lost and the "current coordinate" becomes the "previous coordinate."

Example

```
CALL SETXY(100,100)
```

Sample Program (see LINE)**SETXYR**

Sets Relative Coordinates

SETXYR(p1,p2)

(p1,p2) are INTEGER type and represent Relative Coordinates on the Graphics Screen.

SETXYR sets the current (x,y) coordinates relative to the previously set (x,y) coordinates. For example, if the "current" coordinates are (100,100), CALL SETXYR(10,10) will set the "current" coordinates to (110,110); the "previous" coordinates will then be (100,100).

Example

```
CALL SETXYR(30,30)
```

Sample Program

```

00010 C    DRAW TWO INTERSECTING CIRCLES
00020     CALL GRPINI(1)
00030     CALL CLS(2)
00040     CALL SETXY(100,100)
00050     CALL CIRCLE(50,1,0.0,0.0,0.0)
00060 C    DRAW SECOND CIRCLE WITH CENTER 20
00070 C    PIXELS TO THE RIGHT OF FIRST CIRCLE
00080     CALL SETXYR(20,0)
00090     CALL CIRCLE(50,1,0.0,0.0,0.0)
00100     END
  
```

VIEW

Sets Viewport

VIEW(leftX,leftY,rightX,rightY,color,border)

leftX, leftY, rightX, rightY are INTEGER type and specify the viewport's parameters. leftX and rightX are numeric expressions from 0 to 639 and specify viewport's corner X-coordinates. leftY and rightY are numeric expressions from 0 to 239 and specify the viewport's corner Y-coordinates.

color is LOGICAL type, specifies the OFF/ON color code and is a numeric expression of either 0 (OFF, black), 1 (ON, white), or -1 (viewport is not shaded).

border is LOGICAL type, specifies the border color for the viewport and is an integer expression of either 0 (OFF, black), 1 (ON, white), or -1 (border is not drawn).

VIEW draws viewports on your screen. Graphics is displayed only in the last defined viewport.

The upper-left corner of viewport is read as (0,0) (the "relative origin") when creating items inside the viewport. All the other coordinates are read relative to this origin. However, the "absolute coordinates" of the viewport, as they are actually defined on the Graphics Cartesian system, are retained in memory and can be read using VIEW as a function.

Example

```
CALL VIEW(100,100,200,200,0,1)
```

Sample Program

```
00100 C SAMPLE VIEW PROGRAM
00200 LOGICAL COLOR,BORDER,K
00300 INTEGER FVIEW
00400 CALL GRPINI(1)
00500 CALL CLS(2)
00500 C SET UP VIEW PORT
00700 COLOR=0
00800 BORDER=1
00900 CALL VIEW(210,80,420,160,COLOR,BORDER)
01000 C DRAW MULTIPLE CIRCLES
01100 CALL SETXY(105,40)
01200 DO 20 I=10,150,10
01300 CALL CIRCLE(I,1,0.0,0.0,0)
01400 20 CONTINUE
01500 C DISPLAY VIEWPORT COORDINATES
01600 DO 40 I=1,4
01700 K=I-1
01800 J=FVIEW(K)
01900 WRITE (3,35)I,J
02000 35 FORMAT ('2','VIEW PORT COORDINATE ',I4,' IS AT',I4)
02100 40 CONTINUE
02200 C PRINT EMPTY LINES
02300 DO 60 I=1,12
02400 WRITE (3,50)
02500 50 FORMAT (1H1)
02600 60 CONTINUE
02700 END
```

The following two descriptions are functions in the Graphics Subroutine Library and must be declared as LOGICAL and INTEGER, respectively, in any routine that uses them:

Functions

POINT

Reads Pixel Value at Current Coordinates

V=POINT(X)

X is a dummy variable needed to set up the proper FORTRAN linkage to the POINT routine.

POINT returns the OFF/ON pixel value at current x and y coordinate as specified by SETXY or SETXYR. If the point is not in the current viewport, POINT returns -1.

Example

K=POINT(M)

Sample Program (see PSET)

FVIEW

Reads Viewport's Parameters

FVIEW (n)

n is of LOGICAL type and is an integer expression from 0 to 3.

FVIEW returns the specified viewport parameter:

- 0 = returns left x coordinate of viewport
- 1 = returns the left y coordinate
- 2 = returns the right x coordinate
- 3 = returns the right y coordinate

Example

I=FVIEW(0)

Sample Program (see VIEW)

5/ Assembly Language

The Graphics Subroutine Library (GRPLIB/REL) included on the Graphics Diskette can be linked to any program to access the Graphics Subroutines. The FORTRAN Assembly Subroutine Library (FORLIB/REL) must also be linked (using the L8Ø Linker) to any program that will access the Graphics Subroutines.

Note: To use the Computer Graphics package with Assembly language, you'll need the Editor Assembler (26-47Ø2).

Before any calls are made to the Graphics Subroutines, the FORTRAN Subroutine Library must be initialized. This can be done by having the following as the first executable statements in your assembly program:

```

                LD      BC,L1
                JP      $INIT      ; FORTRAN INIT ROUTINE
L1:              ; YOUR PROGRAM STARTS HERE

```

Note: When you jump to \$INIT, the Stack Pointer will be set to the contents of register pair DE.

Additionally, the Graphics Subroutine Library must be initialized. This is done by inserting a call to GRPINI before attempting to access the Graphics Subroutines Library.

Any errors resulting from incorrect use of the Graphics Subroutines will cause a GRAPHICS ERROR, and control will return to TRSDOS READY.

A program that demonstrates how assembly-language can be used to exercise the Graphics library is included in Appendix D.

You must link the FORTRAN subroutine library as well as the Graphics library to the object code of your graphics program in order to produce an executable load module. A description of the various FORTRAN Library Subroutines such as \$CA, and the Assembler linkage conventions for them can be found in the Editor Assembler User's Manual.

All of the subroutines described in this section have a corresponding subroutine in FORTRAN. If more information is needed to understand a given routine, see the FORTRAN interface section of this manual. In the examples that follow, the Assembler code will define and describe how the given graphics functions are invoked as well as describe the size and format of the parameters.

Important Note: Free memory (above your program) is utilized by the Graphics Subroutines for temporary storage area. Extreme care should be exercised if your program accesses this memory.

BASICG vs. the Graphics Subroutine Library

The Graphics Subroutine Library contains subroutines which provide the same capabilities as the Graphics commands and functions in BASICG. The Graphics subroutines have basically the same names and parameters as the BASICG commands. The major differences between the Library subroutines and the BASICG commands are:

- The BASICG command LINE has 3 corresponding library subroutines: LINE, LINEB, and LINEBF. LINEB and LINEBF provide the functions of the BASICG command LINE with the parameters B and BF respectively.
- The BASICG command PAINT has 2 corresponding library subroutines: PAINT and PAINTT. PAINT is for painting solid black or white, and PAINTT is for using tiling.
- The Library subroutines that correspond to BASICG commands that use (x,y) coordinates (except for VIEW) use (x,y) coordinates that have been previously set. The subroutines used to set the coordinates are SETXY and SETXYR.

Setting Points Using SETXY and SETXYR

The coordinates specified by SETXY or SETXYR will be called the "current" and "previous" coordinates. Subroutines that use one (x,y) coordinate pair use the "current" coordinates and subroutines that use two (x,y) pairs use both the "current" and the "previous" coordinates. Each call to SETXY or SETXYR sets the coordinates as follows:

1. Assign the values of the "current" (x,y) coordinates to the "previous" (x,y) coordinates, (discarding the old "previous" coordinates).

2. Assign new values for the "current" (x,y) coordinates as specified by the arguments supplied. SETXY simply sets the "current" coordinates to the values of its arguments. SETXYR adds the values of its arguments to the "current" coordinates to obtain the new coordinates.

Important Note: All graphics routines utilize the AF, BC, DE, and HL register pairs. It is the user's responsibility to save these registers (if needed) before a call to a graphics routine.

CIRCLE

Draws a circle, arc, or ellipse using the current x and y coordinates as the center.

Example

```

RADIUS: DS      2      ; RADIUS OF CIRCLE
                  ; INTEGER
COLOR:  DS      1      ; Ø->BLACK, 1->WHITE
START:  DS      4      ; SNGL PRECISION FLOATING
                  ; POINT. Ø=CENTER OF
                  ; RIGHT SIDE
END:    DS      4      ; SNGL PRECISION FLOATING
                  ; POINT. IF IT IS = Ø
                  ; 2*PI IS USED.
RATIO:  DS      4      ; SNGL PRECISION FLOATING
                  ; POINT. IF IT IS Ø, .5
                  ; IS USED (CIRCLE).
P3:     DS      6      ; PARAMETERS 3 - 5
        LD      HL,START
        LD      (P3),HL
        LD      HL,END
        LD      (P3+2),HL
        LD      HL,RATIO
        LD      (P3+4),HL
        LD      HL,RADIUS
        LD      DE,COLOR
        LD      BC,P3
        CALL   CIRCLE
  
```

CLS

Clears the screen according to the specified variable.

Example

```

N:      DS      1      ; Ø->CLEAR ONLY TEXT
                  ; 1->CLEAR ONLY GRAPHICS
                  ; 2->CLEAR BOTH TEXT AND
                  ; GRAPHICS
        LD      HL,N
        CALL   CLS
  
```

GET

Reads the contents of a pixel block into memory for future use by PUT.

Example

```
ARRAY: DS      900      ; SPACE TO STORE PIXELS
SIZE:  DW      900      ; SIZE OF STORAGE AREA
      LD      HL,ARRAY
      LD      DE,SIZE
      CALL   GET
```

GRPINI

Graphics initialization routine. This function must be called before any other graphics calls are made.

Example

```
OPTION: DS      1      ; 0 -> CLEAR GRAPHICS
                        ; SCREEN.
                        ; NOT ZERO -> DO NOT
                        ; CLEAR GRAPHICS
                        ; SCREEN.
      LD      HL,OPTION
      CALL   GRPINI
```

LINE

Draws a line between the previous and the current coordinates.

Example

```

COLOR:  DS      1      ; 0->BLACK, 1->WHITE
STYLE:   DS      2      ; ANY 16-BIT PATTERN
                          ; (0FFFFH = SOLID LINE)
          LD      HL,COLOR
          LD      DE,STYLE
          CALL    LINE

```

LINEB

Same as LINE, except LINEB draws a box between the two sets of coordinates.

Example

```

COLOR:  DS      1      ; 0->BLACK, 1->WHITE
STYLE:   DS      2      ; ANY 16-BIT PATTERN
                          ; (0FFFFH = SOLID LINE)
          LD      HL,COLOR
          LD      DE,STYLE
          CALL    LINEB

```

LINEBF

Same as LINEB, except LINEBF fills the box (colors in the box).

Example

```

COLOR:  DS      1      ; 0->BLACK, 1->WHITE
          LD      HL,COLOR
          CALL    LINEBF

```

PAINT

Paints your screen in the specified color (black or white).

Example

```

COLOR:  DS      1           ; 0->BLACK, 1->WHITE
BORDER: DS      1           ; 0->BLACK, 1->WHITE
        LD      HL,COLOR
        LD      DE,BORDER
        CALL    PAINT

```

PAINTT

This routine allows you to paint with a precise pattern by using a technique called 'tiling'.

Example

```

ARRAYT: DS      10          ; DEFINES PATTERN
BORDER: DS      1           ; 0->BLACK, 1->WHITE
ARRAYS: DS      2           ; DESCRIBES BACKGROUND OF
                           ; AREA BEING PAINTED
        LD      HL,ARRAYT
        LD      DE,BORDER
        LD      BC,ARRAYS
        CALL    PAINTT

```

PSET

Sets a pixel either ON or OFF.

Example

```

COLOR:  DS      1           ; 0->OFF, 1->ON
        LD      HL,COLOR
        CALL    PSET

```

PRESET

Same as PSET.

PUT

The given array (stored by GET) is put on the video screen at the current x and y coordinates set by calling SETXY.

Example

```

ARRAY: DS      900      ; STORAGE FOR PIXELS
ACTION: DS      1        ; 1->OR, 2->AND,
                          ; 3->PRESET, 4->PSET, 5->XOR
                          LD      HL,ARRAY
                          LD      DE,ACTION
                          CALL    PUT

```

SCREEN

Allows you to set the screen mode.

Example

```

N:      DS      1        ; 0->GRAPHICS ON/NORMAL
                          ;      SPEED
                          ; 1->GRAPHICS OFF/NORMAL
                          ;      SPEED
                          ; 2->GRAPHICS ON/HIGH
                          ;      SPEED
                          ; 3->GRAPHICS OFF/HIGH
                          ;      SPEED
                          LD      HL,N
                          CALL    SCREEN

```

SETXY

Sets both the current and previous x and y coordinates.

Example

```
X:      DS      2          ; X COORDINATE
Y:      DS      2          ; Y COORDINATE
        LD      HL,X
        LD      DE,Y
        CALL    SETXY
```

SETXYR

Sets the current x,y coordinates relative to the previously set x,y coordinates. For example, if the "current" coordinates are (100,100), SETXYR with x equal to 10 and y equal to 10 will set the "current" coordinates to (110,110); the "previous" coordinates will then be (100,100).

Example

```
X:      DS      2          ; X RELATIVE COORDINATE
Y:      DS      2          ; Y RELATIVE COORDINATE
        LD      HL,X
        LD      DE,Y
        CALL    SETXYR
```

VIEW

Allows you to designate specific areas of your screen where the graphics will be displayed.

Example

```

LEFTX:  DS      2      ; Ø<=LEFTX<=639
LEFTY:  DS      2      ; Ø<=LEFTY<=239
RIGHTX: DS      2      ; Ø<=RIGHTX<=639
RIGHTY: DS      2      ; Ø<=RIGHTY<=239
COLOR:  DS      1      ; Ø->BLACK, 1->WHITE,
                        ; -1 -> DON'T SHADE IT.
BORDER: DS      1      ; Ø->BLACK, 1->WHITE
                        ; -1 -> BORDER NOT DRAWN.
P3:     DS      8      ; PARAMETERS 3 - 6
        LD      HL,RIGHTX
        LD      (P3),HL
        LD      HL,RIGHTY
        LD      (P3+2),HL
        LD      HL,COLOR
        LD      (P3+4),HL
        LD      HL,BORDER
        LD      (P3+6),HL
        LD      HL,LEFTX
        LD      DE,LEFTY
        LD      BC,P3
        CALL    VIEW

```

POINT

Returns the pixel value at the current x and y coordinate.

Example

```
CALL    POINT    ; PUTS VALUE IN A
```

FVIEW

Returns the specified viewport parameter.

Example

```
      N:      DS      1      ; 0->LEFT X COORDINATE
              ;      1->LEFT Y COORDINATE
              ;      2->RIGHT X COORDINATE
              ;      3->RIGHT Y COORDINATE
              LD      HL,N
              CALL   FVIEW ; PUTS VALUE IN HL
```

6/ COBOL Interface

The Graphics diskette contains two files for use with COBOL programs:

- . CBLGRAPH/CPY -- A Cobol source file containing the definitions for the Cobol parameters to use with the graphics routines.
- . CBLGRAPH/CMD -- The graphics subroutine to be called from Cobol programs.

To use Graphics from a COBOL program, the following steps should be taken:

1. In the WORKING-STORAGE SECTION of the COBOL program the following statement should appear:

```
COPY "CBLGRAPH/CPY".
```

This statement should be placed after any 77 level items that may be defined in the program.

2. In the PROCEDURE DIVISION the following statement should appear:

```
CALL GRAPH-SUB USING GRAPHICS-PARAMETERS.
```

This statement gives the Graphics subroutine the address in memory of the parameters to be used by all further Graphics routine calls.

3. The Graphics library and board must be initialized before any other Graphics routines may be done. To initialize the Graphics library and board use the following statement:

```
CALL GRAPH-SUB USING GRPINI-CMD.
```

4. Assign values to the required parameters in GRAPHICS-PARAMETERS (using MOVE or COMPUTE) and call the graphics routine using one of the options defined in GRAPHICS-OPTIONS. The options and parameters are described on the following pages.

5. Compile the program as usual. (RSCOBOL).
6. To run the program add the parameter {T=BA3B} to the end of the RUNCOBOL command line.

Example: RUNCOBOL PROGRAM {T=BA3B}

BASICG vs. the Graphics Subroutine Library

The Graphics Subroutine Library contains subroutines which provide the same capabilities as the Graphics commands and functions in BASICG. The Graphics subroutines have basically the same names and parameters as the BASICG commands. The major differences between the Library subroutines and the BASICG commands are:

- The BASICG command LINE has 3 corresponding library subroutines: LINE, LINEB, and LINEBF. LINEB and LINEBF provide the functions of the BASICG command LINE with the parameters B and BF respectively.
- The BASICG command PAINT has 2 corresponding library subroutines: PAINT and PAINTT. PAINT is for painting solid black or white, and PAINTT is for using tiling.
- The Library subroutines that correspond to BASICG commands that use (x,y) coordinates (except for VIEW) use (x,y) coordinates that have been previously set. The subroutines used to set the coordinates are SETXY and SETXYR.

Setting Points Using SETXY and SETXYR

The coordinates specified by SETXY or SETXYR will be called the "current" and "previous" coordinates. Subroutines that use one (x,y) coordinate pair use the "current" coordinates and subroutines that use two (x,y) pairs use both the "current" and the "previous" coordinates. Each call to SETXY or SETXYR sets the coordinates as follows:

1. Assign the values of the "current" (x,y) coordinates to the "previous" (x,y) coordinates, (discarding the old "previous" coordinates).
2. Assign new values for the "current" (x,y) coordinates as specified by the arguments supplied. SETXY simply sets the "current" coordinates to the values of its arguments. SETXYR adds the values of its arguments to the "current" coordinates to obtain the new coordinates.

Example of a COBOL program using Graphics routines:

```

IDENTIFICATION DIVISION.
. . . (any statements)
ENVIRONMENT DIVISION.
. . .
DATA DIVISION.
. . .
WORKING-STORAGE SECTION.
77 VARIABLE . . . (any 77 level variables)
. . .
COPY "CBLGRAPH/CPY"
. . .
PROCEDURE DIVISION.
START-PROGRAM.
CALL GRAPH-SUB USING GRAPHICS-PARAMETERS.
CALL GRAPH-SUB USING GRPINI-CMD.
CLEAR-SCREENS.
MOVE 2 TO CLEAR-KEY.
CALL GRAPH-SUB USING CLS-CMD. (clear text & graphics screens)
SPECIFY-X-AND-Y.
MOVE 200 TO X-COORD.
MOVE 100 TO Y-COORD.
CALL GRAPH-SUB USING SETXY-CMD. (current point: X,Y = 200,100)
MOVE 50 TO X-COORD, Y-COORD.
CALL GRAPH-SUB USING SETXYR-CMD. (previous point: X,Y = 200,100
current point: X,Y = 250,150)
DRAW-A-BOX.
MOVE 1 TO COLOR. (color on -- white)
MOVE -1 TO STYLE. (solid line pattern)
CALL GRAPH-SUB USING LINEB-CMD. (draw a box with corners
200,100 and 250,150)
. . .
. . . (more program here)
ALL-DONE.
STOP RUN.
END PROGRAM.

```

CIRCLE-CMD -- Draws a circle, arc, or ellipse using the current x and y coordinates as the center.

COMPUTE or MOVE a value to:

COLOR = The color of the circle's border.
Ø=off 1=on.

RADIUS = The radius of the circle in pixels.

START-CIR = The startpoint of the arc. Absolute value between Ø and 6.2831 (2 * PI).
Negative means draw a radius line.

END-CIR = The endpoint of the arc. Same range as START-CIR. A zero value means use default value of 2 * PI.

RATIO-CIR = The aspect ratio of the circle/ellipse. A zero value is interpreted as Ø.5. If RATIO-CIR is Ø.5, a circle will be drawn. Other values are for ellipses.

CALL GRAPH-SUB USING CIRCLE-CMD.

CLS-CMD -- Clears the screen according to the specified variable.

COMPUTE or MOVE a value to:

CLEAR-KEY = Ø to clear text screen, 1 to clear graphics screen, or 2 to clear both screens.

CALL GRAPH-SUB USING CLS-CMD.

FVIEW-CMD -- Returns the specified viewport parameter.

COMPUTE or MOVE a value to:

VIEW-KEY = Ø to return the starting X coordinate,
1 to return the starting Y coordinate,
2 to return the ending X coordinate,
3 to return the ending Y coordinate.

CALL GRAPH-SUB USING FVIEW-CMD.

VIEW-VALUE now contains the value of the coordinate requested by VIEW-KEY.

GET-CMD -- Reads the contents of a pixel block into

TRS-80®

memory for future use by PUT. The previous and current X and Y coordinates define the corners of the graphics block to be read into memory. Sufficient memory must be reserved in WORKING-STORAGE for the graphics data and the name of the storage area must be passed to the graphics routine before GET-CMD may be used. (See GPBUF-CMD.)

Define an area in WORKING-STORAGE to hold the graphics data. The buffer area must be at least as large as:

$$(XP/8 * YP) + 4 \text{ bytes}$$

where XP = the number of X pixels to get and
YP = the number of Y pixels to get.

CALL GRAPH-SUB USING GPBUF-CMD.

CALL GRAPH-SUB USING BUFFER. ("BUFFER" = name of area)

COMPUTE or MOVE a value to:

GET-SIZE = The size of the buffer (in bytes) which was passed after a call using GPBUF-CMD.

CALL GRAPH-SUB USING GET-CMD.

Example use of GPBUF-CMD, GET-CMD, and PUT-CMD:

. . .
WORKING-STORAGE SECTION

. . .
COPY "CBLGRAPH/CPY".
* Reserves 524 bytes of memory for GET and PUT.
Ø1 STORAGE
Ø2 FILLER PIC X(24).
Ø2 FILLER PIC X(1ØØ) OCCURS 5 TIMES.

. . .
PROCEDURE DIVISION.

START-PROGRAM.

CALL GRAPH-SUB USING GRAPHICS-PARAMETERS.
CALL GRAPH-SUB USING GRPINI-CMD.
* Draw a design and set (X,Y) to (1ØØ,5Ø) then (199,89)
. . .
* Pass name of storage area to graphics routine:
CALL GRAPH-SUB USING GPBUF-CMD.
CALL GRAPH-SUB USING STORAGE.
* Size of area = 1ØØ/8 * 4Ø + 4
MOVE 524 TO GET-SIZE.

CALL GRAPH-SUB USING GET-CMD.
* Set (X,Y) to a new point
CALL GRAPH-SUB USING PUT-CMD.

GPBUF-CMD -- Tells graphics routine that next call will specify the buffer for GET-CMD and PUT-CMD.

CALL GRAPH-SUB USING GPBUF-CMD.
CALL GRAPH-SUB USING STORAGE.
where "STORAGE" is the name of the storage area defined in WORKING-STORAGE to be used for GET-CMD and PUT-CMD.

These two calls MUST be together. No other calls to any programs should be made between these calls. The buffer can be re-specified at any time by calling GRAPH-SUB using GPBUF-CMD followed by another call specifying the new buffer. Once a buffer is specified it will be used for all subsequent calls with GET-CMD or PUT-CMD until another buffer is specified.

GRPINI-CMD -- Graphics initialization routine. This function must be called before any other graphics calls are made.

COMPUTE or MOVE a value to:
INIT-KEY = \emptyset to Clear the Graphics Screen; anything else will not Clear the Screen.

CALL GRAPH-SUB USING GRPINI-CMD.

TRS-80[®]

LINE-CMD -- Draws a line between the previous and the current coordinates.

COMPUTE or MOVE a value to:

COLOR = The color of the line. 0=off 1=on.

STYLE = The pattern of the line. The binary value of STYLE indicates a 16-pixel pattern for the line. A zero bit in the pattern means no change. A one bit means set that pixel according to COLOR. For a solid line. STYLE should be -1 (since the binary representation of -1 is all bits are ones).

CALL GRAPH-SUB USING LINE-CMD.

LINEB-CMD -- Same as LINE, except LINEB draws a box between the two sets of coordinates.

COMPUTE or MOVE a value to:

COLOR = The color of the box. 0=off 1=on.

STYLE = The pattern of the box. See LINE-CMD for a description of STYLE.

CALL GRAPH-SUB USING LINEB-CMD.

LINEBF-CMD -- Same as LINEB, except LINEBF fills the box (colors in the box).

COMPUTE or MOVE a value to:

COLOR = The color to use for the filled box.

0=off 1=on.

CALL GRAPH-SUB USING LINEBF-CMD.

PAINT-CMD -- Paints your screen in the specified color (black or white).

COMPUTE or MOVE a value to:

COLOR = The color to paint with. 0=off 1=on.

BORDER = The color of the border where painting should stop. 0=off 1=on.

CALL GRAPH-SUB USING PAINT-CMD.

PAINTT-CMD -- This routine allows you to paint with a precise pattern by using a technique called 'tiling'.

COMPUTE or MOVE a value to:

BORDER = The color of the border where painting should stop. 0=off 1=on.

BACKGROUND = One byte specifying what the background is in the area to be painted. This value will normally be 0 for painting in an area that is already off or 255 (all bits = ones) for painting in an area that is already on.

NUM-TILES = The number of "tiles" in the painting pattern.

TILE array = The pattern to be used for painting. Each TILE should be a number from 0 to 255. The binary value of each TILE specifies the on/off status of a row of 8 pixels.

CALL GRAPH-SUB USING PAINTT-CMD.

POINT-CMD -- Returns the pixel value at the current x and y coordinates.

CALL GRAPH-SUB USING POINT-CMD.

POINT-VAL now contains 0 if the point was off, 1 if the point was on, or -1 if the point was not on the Screen or not in the current viewport.

PSET-CMD -- Sets a pixel defined by the current x and y coordinates either ON or OFF.

COMPUTE or MOVE a value to:

COLOR = The color to set the point. 0=off 1=on.

CALL GRAPH-SUB USING PSET-CMD.

PRESET-CMD -- Same as PSET.

COMPUTE or MOVE a value to:

COLOR = The color to set the point. 0=off 1=on.

CALL GRAPH-SUB USING PRESET-CMD.

TRS-80[®]

PUT-CMD -- The pixel pattern (stored by GET) is put on the video screen at the current x and y coordinates set by calling SETXY or SETXYR.

COMPUTE or MOVE a value to:

ACTION = A number from 1 to 5 specifying how the pixels in the buffer are to be combined with the pixels already on the screen. 1=OR, 2=AND, 3=PRESET, 4=PSET, and 5=XOR.

CALL GRAPH-SUB USING PUT-CMD.

SCREEN-CMD -- Allows you to set the screen mode.

COMPUTE or MOVE a value to:

SCREEN-MODE = A number from 0 to 3 specifying how to set the graphics screen:

0 = graphics on, normal speed
1 = graphics off, normal speed
2 = graphics on, high speed
3 = graphics off, high speed

CALL GRAPH-SUB USING SCREEN-CMD.

SETXY-CMD -- Sets the previous X and Y coordinates to the current X and Y coordinates and sets new current X and Y coordinates.

COMPUTE or MOVE a value to:

X-COORD = The X coordinate
Y-COORD = The Y coordinate

CALL GRAPH-SUB USING SETXY-CMD.

SETXYR-CMD -- Sets the current x,y coordinates relative to the previously set x,y coordinates. For example, if the "current" coordinates are (100,100), SETXYR with x equal to 10 and y equal to 10 will set the "current" coordinates to (110,110); the "previous" coordinates will then be (100,100).

COMPUTE or MOVE a value to:

X-COORD = The X offset. This number will be added to the current X address for the new X address.

Y-COORD = The Y offset.

CALL GRAPH-SUB USING SETXYR-CMD.

VIEW-CMD -- Allows you to designate specific areas of your screen where the graphics will be displayed.

COMPUTE or MOVE a value to:

X-START = The X coordinate for the start of the viewport.

Y-START = The Y coordinate for the start of the viewport.

X-END = The X coordinate for the end of the viewport.

Y-END = The Y coordinate for the end of the viewport.

COLOR = The color of the interior of the viewport.
0=off 1=on, -1 = don't color the viewport.

BORDER = The color of the border of the viewport.
0=off 1=on, -1 = border is not drawn.

CALL GRAPH-SUB USING VIEW-CMD.

Calling Graphics Utilities from a COBOL Program

The graphics utility programs GLOAD, GPRINT, GSAVE, and VDOGRPH may be called from a Cobol program by calling GRAPH-SUB using one of the "-UTIL" options. When any of these options are called no Cobol files should be open as the system will automatically close any open files when one of the utility programs is loaded.

GLOAD-UTIL

Loads graphics memory from a disk file previously written by GSAVE.

```
MOVE the filespec to GFILE.  
CALL GRAPH-SUB USING GLOAD-UTIL.
```

GPRINT-UTIL

Prints graphics memory on a graphics printer.

```
CALL GRAPH-SUB USING GPRINT-UTIL.
```

GSAVE-UTIL

Writes graphics memory to a disk file.

```
MOVE the filespec to GFILE.  
CALL GRAPH-SUB USING GSAVE-UTIL.
```

VDOGRPH-UTIL

Converts the video text display to graphics memory.

```
CALL GRAPH-SUB USING VDOGRPH-UTIL.
```

COBOL Copy Source Code Listing

```

000100*  CBLGRAPH/CPY -- COBOL graphics parameter definitions.
000110*
000120*      This file should be included in the source for any
000130*      Cobol program that will use Graphics Subroutines.
000140*      To do this put this statement in the WORKING-STORAGE SECTION
000150*      after any 77 level items:
000160*
000170*      COPY "CBLGRAPH/CPY".
000180*
000190 01  GRAPH-SUB.
000200*      Name of subroutine to be called is "CBLGRAPH/CMD".
000210*      Use "CALL GRAPH-SUB USING ....." to call graphics.
000220*
000230      02  FILLER  PIC X(12)  VALUE "CBLGRAPH/CMD".
000240*
000250*
000260*
000270 01  GRAPHICS-PARAMETERS.
000280*      Parameters for graphics routines defined here.
000290*      First call to graphics MUST be:
000300*
000310*      CALL GRAPH-SUB USING GRAPHICS-PARAMETERS.
000320*
000330*      ARGS-KEY must be zero.  Do NOT change this value.
000340      02  ARGS-KEY  COMP-1  PIC 99 VALUE 0.
000350*
000360*      Init key for GRPINI-CMD (0=clear, >0=don't clear Graphics)
000370      02  INIT-KEY  PIC 9  VALUE 0.

7/ Programming the Graphics Board

The Graphics Board provides 640 X 240 byte addressable pixels on a TRS-80 Model II. The Graphics Board contains 32K of screen RAM to store video data. Regular alphanumeric data is stored in the static RAM on the Video board. The Graphics Board uses the Video board's circuitry as much as possible to minimize the hardware.

I/O port mapping is used to read and write data to the board. A DIP switch selects a 16-byte boundary (00H, 10H, 20H...F0H) in the entire I/O space. The use of port mapping allows the board to reside transparent to TRSDOS.

There are four internal registers which can be written to or read on the board. They are as follows:

1. **X-Position** - X-address (0 to 79) for data write only.
2. **Y-Position** - Y-address (0 to 239) for data write only.
3. **Data** - Graphics data in "byte" form. Each byte turns on or off 8 consecutive horizontal dots.
4. **Options** - 8 flags which turn on or off the user programmable options. (write only)

The I/O port mapping of the board is:

- . x0 - X-Register Write
- . x1 - Y-Register Write.
- . x2 - Video data read or write.
- . x3 - options write.

where x denotes the upper nibble of the I/O boundary as set by the DIP Switches. They are set by the factory at 80H.

The Graphics Board uses X-Y addressing to locate the start of a Graphics DATA BYTE. The upper-left of the Screen is (0,0) while the lower-right is (079,239). If the bit is a 1, the dot will be ON. For example, if you wanted to turn on the 5th dot on the top row, the registers would contain: X POSITION=0, Y POSITION=0, DATA=(00001000)=08H. Note that

in calculating points to plot, the Y-position is correct for a single dot. Only the X-position must be corrected to compensate for the byte addressing. This can be accomplished in a simple subroutine.

An option lets the Graphics Board insert WAIT STATES any time the graphics RAM is not accessed during a retrace. This prevents "flashing" of the display. The worse case access time for a read or write would be 64 uS, as opposed to about 12 uS without wait states. Another way to prevent flashing is to blank out the graphics display until all drawing is complete, then turn the graphics on. The hardware is such that the alphanumeric video data and the graphics data are overlaid. When you try to overlay solid white graphics directly over alphanumerics, the alphanumerics will appear as Reverse Video so they can be read.

Line Drawing Options

There are two 8-bit counters which act as latches for the X- and Y-address. You may select, through the options register, if they are to automatically count after a read or write to graphic memory. Also, the counters may increment or decrement independently. These counters do not count to their respective endpoints and reset. Instead, they will overflow past displayable video addresses. Therefore, the software must not allow the counters to go past 79 and 239 or unpredictable results may occur.

Examples

The following are brief examples on how to use the Graphics Board.

Read the video byte at X=0, Y=0

```
XOR A           ;CLEAR A
OUT (80H),A     ;OUTPUT X ADDRESS
OUT (81H),A     ;OUTPUT Y ADDRESS
IN  A,(82H)     ;READ VIDEO BYTE
```

Draw a line from X=0,Y=0 to X=639, Y=0 using the hardware line drawing

```
LD  B,79        ;B HAS CHARACTER COUNT
```

TRS-80[®]

```
LD  A,10110001B ;OPTIONS:INCREMENT X AFTER WRITE
OUT (83H),A      ;AND NO WAITS
XOR  A
OUT (80H),A      ;OUT X ADDRESS STARTING
OUT (81H),A      ;OUTPUT Y ADDRESS
LD  A,0FFH       ;LOAD A WITH ALL DOTS ON
LOOP OUT (82H),A ;OUTPUT DOTS
DJNZ LOOP        ;OUTPUT NUMBER IN B REGISTER
```

Options Programming

No.	Option	Description
∅	GRAPHICS/ALPHA*	Turns ON and OFF graphics. "1" turns graphics ON.
1	WAITS ON/OFF*	If WAITS are /ON the screen does not "flash" when Reading or Writing to graphics. A "1" selects WAITS.
2	XREG DEC/INC*	Selects whether X decrements or increments. "1" selects decrement.
3	YREG DEC/INC*	Selects whether Y decrements or increments. "1" selects decrement.
4	X CLK RD*	If address clocking is desired, a "∅" clocks the X address up or down AFTER a Read depending on the status of BIT 2.
5	Y CLK RD*	If address clocking is desired, a "∅" clocks the Y address up or down AFTER a Read depending on the status of BIT 3.
6	X CLK WR*	A "∅" clocks AFTER a Write.
7	Y CLK WR*	A "∅" clocks AFTER a Write.

Table 9. Options Programming

Appendix A/ BASICG/Utilities Reference Summary

Utilities are shaded like this.

Argument ranges are indicated below by special letters and words:

ar is a single-precision floating point number > 0.0 (to $1 * 10^{38}$).

b is an integer expression of either 0 or 1.
B specifies a box.
BF specifies a shaded box.

c is an integer expression of 0 or 1.
n is an integer expression from 0 to 2.
p is an integer expression from 0 to 3.
r is an integer expression from 0 to 639.
x is an integer expression from 0 to 639.
y is an integer expression from 0 to 239.

action is either AND, PSET, PRESET, OR, or XOR.
background is a string.
border is an integer expression of either 0 or 1.
end is an expression from -6.283185 to 6.283185.
start is an expression from -6.283185 to 6.283185.
switch is an integer expression of 0 or 1.
tiling is a string or an integer expression of 0 or 1.
type is an integer expression from 0 to 3.

CIRCLE(x,y)r,c,start,end,ar Draws circle, ellipse, semi-circle, arc, or point.

CIRCLE(100,100),25,1 CIRCLE(150,150),40,1,,,6
 CIRCLE(100,100),100,PI,2*PI,5 CIRCLE(-50,-50),200

CLS Clears the Text Screen and video memory.

CLS SYSTEM"CLS"

CLS n Clears Screen(s).

CLS CLS2

GCLS Clears the Graphics Screen and memory.

GCLS SYSTEM"GCLS" 100 SYSTEM"GCLS"

GET(x1,y1)-(x2,y2),array name Reads the contents of a rectangular pixel area into an array.

GET(10,10)-(50,50),V

GLOAD filename /ext .password :d (diskette name)

Loads graphics memory.

GLOAD PROG SYSTEM"GLOAD PROG"

GPRINT Dumps graphic display to printer.

GPRINT SYSTEM"GPRINT" 100 SYSTEM"GPRINT"

GSAVE filename /ext .password :d (diskette name)

Saves graphics memory.

GSAVE PROG SYSTEM"GSAVE PROG"

GROFF Turn Graphic Display OFF.

GROFF SYSTEM "GROFF"

GRON Turn Graphic Display ON.

GRON SYSTEM "GRON"

LINE(x1,y1)-(x2,y2),c,B or BF, style Draws a line/box.

LINE -(100,100) LINE(100,100)-(200,200),1,B,45

LINE(0,0)-(100,100),1,BF LINE(-200,-200)-(100,100)

PAINT(x,y),tiling,border,background Paints

Screen.

PAINT(320,120),1,1 PAINT(320,120),"DDDDD",1

PAINT(320,120),A\$,1

PAINT(320,120),CHR\$(0)+CHR\$(&HFF),0,CHR\$(&H00)

PAINT(320,120),CHR\$(E)+CHR\$(77)+CHR\$(3)

POINT(x,y) A function. Tests graphics point.

PRINT POINT(320,120) IF POINT(320,120)=1 THEN . . .

PRINT POINT(320,120),-1

PRESET(x,y),switch Sets pixel OFF or ON.

PRESET(100,100),0

PSET(x,y),switch Sets pixel ON or OFF.

PSET(100,100),1

PUT(x1,y1),array name,action Puts graphics from an array onto the Screen.

PUT(100,100),A,PSET PUT(100,100),A,AND

PUT(A,B),B

SCREEN type Selects Screen/graphics speed.
SCREEN 2

VDOGRPH Transfers video memory to graphics memory.
VDOGRPH SYSTEM"VDOGRPH" 100 SYSTEM"VDOGRPH"

VIEW(x1,y1)-(x2,y2),c,b Redefines Screen and
creates a viewport.
VIEW(100,100)-(150,150) VIEW(100,100)-(150,150),0,1

VIEW(p) A function. Returns viewport's coordinates.
PRINT VIEW(1)

Appendix B/ BASICG Error Messages

```
=====
```

Code	Abbre- viation	Explanation
1	NF	NEXT without FOR. NEXT is used without a matching FOR statement. This error may also occur if NEXT variables are reversed in a nested loop.
2	SN	Syntax. This is usually the result of incorrect punctuation, an illegal character or a misspelled command.
3	RG	RETURN without GOSUB. A RETURN statement was executed with insufficient data available. The DATA statement may have been left out or all data may have been read.
4	OD	Out of data. A READ statement was executed with insufficient data available. The DATA statement may have been left out or all data may have been read.
5	FC	Illegal function call. An attempt was made to executed an operation using an illegal parameter. Graphic examples: PUTing a display that is partially off the Screen, GETing an array that is not properly dimensioned, or using more than two OFF tiles or two ON tiles in a strings when tiling (with PAINT).
6	OV	Overflow. The magnitude of the number derived or input is too large for the data storage type assigned to it. The integer range is (-32768 to 32767) for BASICG.
7	OM	Out of memory. All available memory has been used or reserved. This may occur with large array dimensions and

		nested branches such as GOSUB and FOR/NEXT loops.
8	UL	Undefined line. An attempt was made to reference a non-existent line.
9	BS	Bad subscript. An attempt was made to assign an array element with a subscript beyond the dimensioned range.
10	DD	Double-dimensioned array. An attempt was made to dimension an array which had previously been created with DIM or by default statements. ERASE must be used first.
11	/0	Division by zero. An attempt was made to use a value of zero in the denominator. Note: If you can't find an obvious division by zero, check for division by numbers smaller than allowable ranges (see OV above).
12	ID	Illegal direct. An attempt was made to use a program-only statement like INPUT in an immediate (non-program) line.
13	TM	Type mismatch. An attempt was made to assign a number to a string variable or a string to a numeric variable.
14	OS	Out of string space. The amount of string space allocated was exceeded. Use CLEAR to allocate more string space. 100 bytes is the default string space allocation.
15	LS	Long string. A string variable was assigned a string which exceeded 255 characters in length.
16	ST	String too complex. A string operation was too complex to handle. The operation must be broken into shorter steps.
17	CN	Can't continue. A CONT command was given at a point where the command can't be carried out, e.g., directly after the

TRS-80[®]

program has been edited.

18	UF	Undefined user function. An attempt has been made to call a USR function without first defining its entry point via a DEFUSR statement.
19	NR	No RESUME. During an error-trapping routine, BASIC has reached the end of the program without encountering a RESUME.
20	RW	RESUME without error. A RESUME was encountered when no error was present. You need to insert END or GOTO in front of the error-handling routine.
21	UE	Undefined error. Reserved for future use.
22	MO	Missing operand. An operation was attempted without providing one of the required operands.
23	BO	Buffer overflow. An attempt was made to input a data line which has too many characters to be held in the line buffer.
24	NB	Files not compatible. An attempt was made to load a BASIC file (in compressed format) into BASICG.
25-49	UE	Undefined error. Reserved for future use.
50	FO	Field overflow. An attempt was made to Field more characters than the direct-access file record length allows. The record length is assigned when the file is first opened. The default length is 256.
51	IE	Internal error. Also indicates an attempt to use EOF on a file which is not open.
52	BN	Bad file number. An attempt was made to use a file number which specifies a file that is not open or that is greater than

TRS-80[®]

		the number of files specified when BASICG was started up.
53	FF	File not found. Reference was made in a LOAD, KILL or OPEN statement to a file which did not exist on the diskette specified.
54	BM	Bad file mode. Program attempted to perform direct access on a file opened for sequential access or vice-versa.
55	AO	File already Open. An attempt was made to open a file that was already open. This error is also output if KILL, LOAD, SAVE, etc., is given for an open file.
56	IO	Disk I/O error. An error has been detected during a disk access.
57	FE	Undefined in Model II BASIC.
58	UE	Undefined error. Reserved for future use.
59	DF	Diskette full. All storage space on the diskette has been used. KILL unneeded files or use a formatted, non-full diskette.
60	EF	End of file. An attempt was made to read past the end of file.
61	RN	Bad record number. In a PUT or GET statement, the record number is either greater than the allowable maximum, equal to zero, or negative.
62	NM	Bad file name.
63	MM	Mode mismatch. A sequential OPEN was executed for a file that already existed on the diskette as a direct access file, or vice versa.
64	UE	Undefined error. Reserved for future use.

65 DS Direct statement. A direct statement was encountered during a load of a program in ASCII format. The load is terminated.

66 FL Too many files.

=====

Appendix C/ Subroutine Language Reference Summary

- CIRCLE** (radius,color,start,end,ar) Draws circle, ellipse, semi-circle, arc, or point.
(x,y) coordinates set by SETXY.
CALL CIRCLE(100,1,0,0,0)
- CLS** (n) Clears Screen.
CALL CLS(2)
- FVIEW** (n) Returns viewport parameter.
I=FVIEW(0)
- GET** (array,size) Reads the contents of a rectangular pixel area into an array for future use by PUT.
CALL GET(A,4000)
- GRPINI**(option) Graphics initialization routine.
CALL GRPINI(0)
- LINE** (color,style) Draws a line.
Coordinates set by SETXY or SETXYR.
CALL LINE (1,-1)
- LINEB** (color,style) Draws a box.
Coordinates set by SETXY or SETXYR.
CALL LINEB (1,-1)
- LINEBF** (color) Draws a filled box.
Coordinates set by SETXY or SETXYR.
CALL LINEBF (1)
- PAINT** (color,border) Paints Screen.
CALL PAINT(1,1)
- PAINTT** (arrayT,border,arrayS) Paints Screen with defined paint style.
CALL PAINTT (A,1,V)
- POINT** Returns pixel value at current coordinates.
K=POINT(M)
- PRESET** (color) Sets pixel ON or OFF.
CALL PRESET(0)

PSET (color) Sets pixel ON or OFF.
CALL PSET(0)

SCREEN (n) Sets Screen/graphics speed.
CALL SCREEN(2)

SETXY(X,Y) Sets coordinates (absolute).
CALL SETXY(100,100)

SETXYR(X,Y) Sets coordinates (relative).
CALL SETXYR(50,50)

VIEW(leftX,leftY,rightX,rightY,color,border)
Sets viewport.
CALL VIEW(100,100,200,200,0,1)

Appendix D/ Sample Programs**BASICG**

```
10 '
20 ' Pie Graph Program ("PECANPIE/GRA")
30 '
40 ' Object
50 'The object of this program is to draw a pie graph of the
60 'expenses for a given month of eight departments of a
65 ' company,
70 ' along with the numerical value of each pie section
80 ' representation.
90 '
100 '
110 ' Running the program
120 'The month and the amounts spent by each department are
130 ' input, and the program takes over from there.
140 '
150 ' Special features
160 'The amounts spent by each account as well as the total
170 'amount spent are stored in strings. The program will
180 'standardize each string so that it is 9 characters long
190 'and includes two characters to the right of the decimal
200 'point. This allows for input of variable length and an
210 'optional decimal point.
220 '
230 'The various coordinates used in the program are found
240 ' based on the following equations:
250 '
260 'x = r * cos(theta)
270 'y = r * sin(theta)
280 '
290 'where x and y are the coordinates, r is the radius,
295 'and theta is the angle.
300 '(Note: The y-coordinates are always multiplied
310 'by 0.5. This is because the y pixels are twice the
315 'size of the x pixels.)
330 '
340 'If an angle theta is generated by a percent less than
345 ' 1%, the section is not graphed, and the next theta is
350 ' calculated.
360 'However, the number will still be listed under the key.
370 '
```

```

Printing Graphics Displays

There are many ways to use the stand-alone utilities (described in Graphic Utilities). The following discussion demonstrates one way to use the utilities with graphic displays generated under BASICG.

To print graphics, follow these steps:

1. When TRSDOS READY appears, set FORMS to FORMS P=66 L=60 W=0 C=0. Then type: FORMS X <ENTER>. (See your Model II Owner's Manual).
2. Set the printer into Graphic Mode and set the printer's other parameters (elongation, non-elongated, etc.), if applicable, according to instructions in your printer owner's manual.
3. Write, run and save your program as a BASICG program file.
4. Transfer the contents of the video display to graphics memory using VDOGRPH.
5. Save the graphics memory to diskette using GSAVE.
6. Load the file into memory using GLOAD.
7. Enter the print command GPRINT.

Example #1:

1. Set FORMS and your printer's printing parameters.
2. Load BASICG and type in this program:

```
10 DEFDBL Y
20 CLS2
30 LINE (0,120)-(640,120)
40 LINE (320,0)-(320,240)
50 FOR X=0 TO 640
60 PI=3.141259
70 X1=X/640*2*PI-PI
80 Y=SIN(X1)*100
90 IF Y>100 THEN X=X+7
100 PSET (X,-Y+120)
```

```
11Ø NEXT X
12Ø PRINT "THIS IS A SINE WAVE."
13Ø SYSTEM"VDOGRPH"
```

3.RUN the program.

The program draws a sine wave on the Graphics Screen (graphics memory) and prints the statement in line 12Ø ("THIS IS A SINE WAVE.") on the Text Screen (video memory).

4.At the end of program execution, video memory is converted to graphics memory, as specified in program line 13Ø. The Text Screen is converted to graphics and then erased.

5.SINE (for sine wave) is the name we are giving this TRSDOS file. To save the contents of the graphics memory (which now includes the converted video memory) to diskette, type: SYSTEM "GSAVE SINE" <ENTER>

6.The graphics memory is saved as a TRSDOS file on your diskette.

7.Type: CLS2 <ENTER>

All video and graphics memory is now cleared.

8.To load the file back into memory, type:
SYSTEM "GLOAD SINE" <ENTER>

The display is now on the Graphics Screen.

1Ø. To print, type: SYSTEM "GPRINT" <ENTER>

Assembly Language Sample

The following is an assembler linker routine.

```

Appendix F/ Pixel Grid Reference

The following hexadecimal numbers include commonly used tiling designs.

Important Note: You cannot use more than two empty rows of tiles when tiling or you'll get an Illegal Function Call error.

Example (four rows of empty tiles):

```
CHR$(&HFF)+CHR$(&HFF)+CHR$(&H00)+CHR$(&H00)+CHR$(&H00)+CHR$(&H00)
```

gives you a Function Call error.

1. "X"

```
CHR$(&H41)+CHR$(&H22)+CHR$(&H14)+CHR$(&H08)+CHR$(&H14)  
+CHR$(&H22)+CHR$(&H41)+CHR$(&H00)
```

Hex Decimal

SERVICE POLICY

Radio Shack's nationwide network of service facilities provides quick, convenient, and reliable repair services for all of its computer products, in most instances. Warranty service will be performed in accordance with Radio Shack's Limited Warranty. Non-warranty service will be provided at reasonable parts and labor costs.

Because of the sensitivity of computer equipment, and the problems which can result from improper servicing, the following limitations also apply to the services offered by Radio Shack:

1. If any of the warranty seals on any Radio Shack computer products are broken, Radio Shack reserves the right to refuse to service the equipment or to void any remaining warranty on the equipment.
2. If any Radio Shack computer equipment has been modified so that it is not within manufacturer's specifications, including, but not limited to, the installation of any non-Radio Shack parts, components, or replacement boards, then Radio Shack reserves the right to refuse to service the equipment, void any remaining warranty, remove and replace any non-Radio Shack part found in the equipment, and perform whatever modifications are necessary to return the equipment to original factory manufacturer's specifications.
3. The cost for the labor and parts required to return the Radio Shack computer equipment to original manufacturer's specifications will be charged to the customer in addition to the normal repair charge.
