NEWDOS/80 Version 2.0 The Support Keeps Coming.

Apparat's newest disk operating system for the TRS-80®, NEWDOS/80 Version 2.0, has added many new enhancements and features to make your Model I or III computer more powerful. We've kept one thing the same. Our support. Version 2.0 is our second upgrade of our original NEWDOS for the TRS-80. Each version builds and improves on the capabilities of the preceding versions. Just as important, Apparat's commitment to supporting our products makes a good product even better. By providing our customers with zaps on an ongoing basis, we're continually making NEWDOS/80 Version 2.0 a more powerful tool.

Version 2.0...

High Performance DOS

NEWDOS/80 Version 2.0 builds even more performance into NEWDOS/80. The versatility and sophistication of Version 2.0 includes features like:

- Double density support on the Model I
- Enhanced compatibility between Model I and III
- Triples directory size
- Dynamically merge in basic (also allows merging of non ASC II format files)
- Selective variable clearing
- Can display basic listings page by page

- Automatic repeat function key
- Routing for peripheral handling
- Enhanced disassembler
- Command chaining
- Superzap to scan files
- Fast sort function in basic

These new features, added to the existing capabilities of NEWDOS/80, makes it one of the most powerful additions you can make to your system. And Apparat's commitment to support assures that you've purchased a superior product, both today and tomorrow. At just \$149.00 it could be the best investment you will make for your TRS-80.

If you're thinking about upgrading your system, call Apparat today. Dealer inquiries welcome.

"ON GOING SUPPORT FOR MICROCOMPUTERS"

Dosplus shifts into overdrive for business.

THE NEW DOSPLUS 4.0 HARD DRIVE SYSTEM MEANS BUSINESS

MAKE A SWIFT SHIFT The DOSPLUS 4.0 Hard Drive System turns your TRS-80 into a powerhouse for business applications. Shifting up to a hard drive is just like moving up from tape to floppy. It makes good business sense. You get the power, the dependability, the speed and capacity of a hard drive to power the software you need to keep your business in top gear.

MIND YOUR OWN BUSINESS The power potential of the TRS-80 driven by DOSPLUS 4.0 Hard Drive System lets you mind your own business just like the big companies do. You can control accounts receivable, accounts payable, inventory, payroll, invoicing and a whole lot more accurately and with confidence because DOSPLUS 4.0 is the only current operating system designed from conception for hard disk operation.

DOSPLUS 4.0 T.C.B. (Takes Care of Business) What good is a DOS if you have to spend so much time getting it to perform properly that your business suffers? The DOSPLUS Hard Drive System takes care of the computer while you take care of your business. It's a smooth, swift and silent business partner with the potential to handle up to 40 megabytes of capacity in 4, 10 meg units." So now you can shift your TRS-80 into over drive with DOSPLUS.

THE DOSPLUS 4.0 FEATURES

- Single volume addressing/Double sided floppies seen

as one drive—Any single file can expand to limit of hard drive (up to 10 meg.)

- Hard disk—disk editing utilities • Incredible I/O speed
- Runs any combination of densities or tracks
- Also operates 8" drives with special hardware—comes with expanded users guide and complete DOS technical section on I/O calls and DCB organization
- "PLUS" ALL OF THE SENSATIONAL NEW DOSPLUS 3.4 FEATURES

THE DOSPLUS 4.0 HARD DRIVE SYSTEM

- Smooth, silent, swift • Error-free disk I/O
- *Add on up to 4, 10 meg units for a total of 40 megabytes!
- Plugs on the 50 pin data bus.—no loss of floppy drives
- Completely self-contained—just plug it in and go
- * 10 meg units available Soon.

NOTE: Specify 40 or 80 track when ordering DOS diskette. After initial bootup, user can create any DOS desired.

STARTING FROM \$2995 TAKE YOUR COMPLETE MICRO TO THE MAX.

Lifetime warranty on original media.

So Far, So Good...

**Your Model III is a fine computer.
So why settle for less than
a fine disk storage system?**

A fast, reliable disk storage system — no other device is so vital to the satisfactory performance of your computer. At Percom we build quality, high-performance disk drive systems. From gold-plated connector contacts to goldcad metal chassis structures. From proven design through 100% reliability testing. Percom disk systems are the standard by which others are judged — the industry's "gold standard," in a sense. And since Percom is the largest independent manufacturer of disk systems for microcomputers, you get Percom quality at very competitive prices. Add-on drives for TRS-80* computers start as low as \$399. Complete first-drive systems for the Model III start at only \$599. Put a quality Percom mini-disk storage system in your Model III. And save.

#1 For Your Model III

Percom TFD drives for your TRS-80* Model III computer are available in 40- and 80-track versions with single or dual heads. Single-head 40-track drives store 180 Kbytes; dual-head 40-track drives store 360 Kbytes. Eighty-track drives store slightly over twice these amounts. Of course these are formatted capacities. The Percom Model III controller handles up to four drives so it's possible to access almost three million bytes of on-line program and data files. You get Percom's OS-80/III Basic language DOS with each first-drive system, and your first drive may be either internal (add-in) or external (add-on). Percom TFD drives work with Model III TRSDOS and other Model III disk-operating systems. First-drive systems are pre-assembled. Installation is accomplished with simple tools.

#1 For Your Model I, Too

Percom TFD add-on drives for the TRS-80* Model I computer are available with the same features and the same quality control measures as TFD Model III drives. As for Model III drives, all Percom Model I drives are double-density rated. Install Percom's popular DOUBLER II in your Model I Expansion Interface and upgrade your Model I to provide the same storage capacity as the Model III.

Watch for Announcement of Percom's Low-Cost Hard Disk System for the Model III!

For TRS-80 Models I and III

Introducing the Lowest Cost Hard Disk System Ever . . . Laredo's LS525.

\$1995*

5 million low cost bytes of on-line storage.

At \$1995.00 affordable hard disk storage is now within your reach.

The LS525 hard disk system is easier to use than your printer . . . just plug it in switch it on and your disk storage problems are over forever.

The LS525 gives you unheard-of speed and reliability. For starters we built a "mainframe like" controller that can detect disk surface defects and relocate the data to alternate tracks. Talking about speed the LS525 can access files 10 times faster than your floppy.

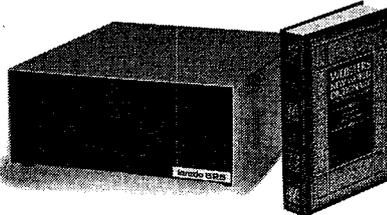

This coupled with proven "winchester" technology is what we mean by reliability and speed.

We also provide a user-friendly TRSDOS compatible operating system in which all of your existing soft-

ware can run on. It provides features that can make the LS525 look like one big 5M byte drive or four small 1.25M drives or whatever you like.

The LS525 is a compact (less than one half cubic foot) "color-keyed" package that will fit perfectly next to your TRS-80. So if your tired of seeing "Disk Space Full". . . .

. . . there's no excuse.

Call toll free and order yours now.

ARTICLES

Space photography at J.P.L. 16

Model I/III

Harry Avant

A hardware interface that is currently being used by Jet Propulsion Laboratories to acquire, store and manipulate photographic density and temperature in a high volume photo processing facility. The data is generated from production of images by unmanned spacecraft.

Geosynchronous satellite pointing 19

Model I/III

Dana Waldman, Mark Felton

Use spherical geometry to locate satellites over the United States. Allows entry of up to twenty satellites and their longitudes into a satellite data file.

The Color Computer as a planetarium 24

Color Computer

T. R. Dettmann

Displays an interesting application of Color Computer graphics functions by observing the nine planets and their relative positions.

TRS-80 Model I work-alike 28

LNW-80

Frank Fischer, Eric Hilberg

An evaluation of the LNW-80 microcomputer. Build your own computer.

Add disk and memory to Model III 30

Model III

Sal Navarro

Save money by installing 48K of RAM and disk drives to your Model III with a new kit.

Solving simultaneous linear equations 34

Model I, II and III

J. C. Adams, Jr., Ph.D.

A BASIC version of the Scientific Subroutine Package (SIMQ) is used in solving sets of simultaneous linear algebraic equations.

Small business invoice program 42

Model I/III and Color Computer

Fred Blechman

This program will print and total an invoice, showing each purchase as well as special items and remarks, and print out address labels.

Interest calculations 48

Model I/III Charles R. Jones
Generate comparative data with this program for six types of interest calculations.

Screen printing with MX-80 54

Model I/III Ron Goodman
By using this program with an MX-80 printer, you can have the advantages of a screen print button.

Files and foibles 57

Model I, II and III T. R. Dettmann
Use list linking for efficiently controlling disk files and avoid much of the "thrashing" normally associated with this technique.

Base conversions with the Pocket Computer 62

Pocket Computer Peter G. Savard
A program for hex to decimal conversions as well as other small programming chores.

GOSUB-RETURN 64

Model I, II and III T. R. Dettmann
An examination of the GOSUB-RETURN function for beginning programmers.

Spaceship Orbitor 66

Model I/III Delmer D. Hinrichs
If you're tired of "Lunar Lander", try this program. It's a realistic orbital mechanics simulation with graphics which require astronaut-level skills.

The Color Computer grows up 83

Color Computer Don Scarberry
Turn your Color Computer into a disk system with up to four drives.

Editor/Assembler 1.2 for three 86

Model III Kent G. Rothrock
The Model I Editor Assembler can be revised to operate on the Model III and improved for the Model I.

MX-80 mods for Model I 90

Model I Robert L. Green
A modification to enable Model I owners without an expansion interface to use the MX-80 printer.

High-res graphics for the Color Computer 104

Color Computer Richard Tangeman
Generate alphanumeric characters in high-resolution mode.

Editorial

Space: The final frontier — or is it the first real frontier? I remember being a patient in a veteran's hospital back in November, 1957, when the Russians put up their Sputnik. It was a big deal, no doubt about it. I had all the ear-marks of the beginning of something really big. It was, for a few years.

An ex-sergeant, who believed the earth was flat, said they were just putting one over on us. He said it was just another of those red-commie tricks and that they probably did it all with mirrors. Besides, he said, he had an amateur radio friend who couldn't pick up the signals, supposedly on or near the 20-meter ham band. It was enough to make a non-believer out of him.

The grand show came in 1969. The first man to set foot on the moon was an exciting spectacle. We all had the honor of watching it on television. It was a show to remember, and in our time zone it was conveniently staged on a Sunday afternoon.

The Russians always did their things first, then told about them later. Ours was very different. We watched the drama as it unfolded. Anything could go wrong and the whole world could witness it. (We either lucked out, or our mirrors worked better than theirs.) We got there and back, and then did it a few more times just to make sure that everyone knew that we could.

Everyone remembers the names of Armstrong, Aldrin and Collins. I always felt sorry for Mike Collins. He made it all the way to the moon and couldn't be one of the first to set foot upon it. He wrote a book about it later and called it "Carrying the Flame". In it, he hinted that it didn't bother him not to set down on the surface. It was the one part of his book I couldn't believe.

After the Apollo missions had come and gone, everyone expected to see more. It had been an excellent start, but somebody slammed the funding door in Washington and cut the whole manned program back. It's really too bad. According to one of the first three astronauts, it had cost each man, woman and child in the United States a little less than two dollars each to put those men on the moon.

Where else are you going to get that kind of entertainment for under two bucks apiece? Aside from the drama of it all, look at the advances in technology which came about from the space program. The microcomputer I used to write this editorial is just one example. There are a hundred more advances in electronics and medicine alone. We not only had a show, but are living better because of it. It's a shame the program was cut back.

I'm not a Bible-beater, but there is something to the phrase "beat your swords into plowshares". It's still good advice. There is nothing that would spur our "down" economy more than a joint manned space effort. Being involved in space exploration with your adversary could lead to better relations all around. Besides, we still have to convince the ex-sergeant that the earth is indeed shaped like an oblate spheroid.

Mike

MAY SPECIALS

SUPERKEYS

ADVANCED OPERATING SYSTEMS

SUPERKEYS is a powerful keyboard utility program which changes your TRS-80 keyboard into a super-keyboard. Now you can perform valuable time-saving single-key programming. Up to 255 different keyboard characters can be assigned to a key or keys. Functions such as RUN, LIST, ENTER, BREAK, and EDIT as well as frequently used graphic strings can be saved and recalled with one key.

Cat. No. 3612 MIII, 16K, disk \$49.95

LDOS 5-1

LOGICAL SYSTEMS

The ideal Disk Operating System for your TRS-80 Model I or III computer. Many advanced features allow the novice or professional programmer to fully utilize the power of the Model I or III. Extensive documentation is included.

Cat. No. 3053 MI, L2, 32K, disk \$169.00
Cat. No. 3189 MIII, 32K, disk \$169.00

DATALIFE DISKETTES

The symbol of quality for data storage on your TRS-80's or any soft-sector computer. Each disk is rated for 40-track, single or double density operation. Complete with Hub rings. Box of 10.

Cat. No. 1147 SINGLE-SIDED \$28.00 by VERBATIM
Cat. No. 1492 DOUBLE-SIDED \$45.00

MODEL III DISK CONTROLLER

Now Model III owners can upgrade their systems for a fraction of the previous cost. Some of the outstanding features of this controller are:

- single or double density operation
- single or double sided drives
- 40 or 80 track capability

The Model III controller kit comes complete with all boards, cables, mounting hardware, and instructions. Recommended drives are Tandon drives. Installation requires a certain amount of mechanical aptitude.

Cat. No. 3383 \$395.00

COMPLETE DRIVE PACKAGES

Package includes controller kit plus choice of disk drive configurations. Drives used are the Tandon TM100-1 (single-side, 40 track, single/double density) and TM100-2 (double-side, 40 track/side, single/double density).

SINGLE DRIVE CONFIGURATIONS	DUAL DRIVE CONFIGURATIONS

After reading one (of your issues), I can see why Computerland never has any in stock! I got three useful (and well used) programs and a lot of good ideas out of the February 1982 issue. What I especially liked is the way your articles are written. I was even more pleased when the programs I typed in worked. That is more than I can say for a lot of other programs I have typed in. Keep up the good work!

**Carl Brown
Hershey, PA**

I am sure that you are constantly seeking ideas for future publication and in that vein I would like to offer my suggestions.

Two of the most widely used programs are VisiCalc and Scripsit. I find the documentation for Scripsit sadly lacking and inadequate. I would love to see a series of articles dedicated to the use of Scripsit on the Model I and III. An adjunct to this would be the use of Scripsit with some of the Superscript programs as used with some of the most popular printers (Epson 80, and 100 and others). This series of articles could fill a wide gap in the documentation.

VisiCalc is probably the most powerful program I have ever used. I have achieved some expertise with the program but am sure that there are tons of VC secrets out there. Some businessman (*must be*) using VC in an application not thought of by others. I would like to see articles on its use with sister programs that add to its usefulness. I can't afford to buy and try all these programs but on the recommendation of an article I certainly would purchase one or more if they filled my needs.

I would also like to see more programs or suggestions for uses of the micro for Attorneys. I recently started a project for an attorney and am finding many uses such as the printing of more than 50 form letters that many attorneys use.

**Richard Eidmann
Philadelphia, PA**

Thank you for the suggestions. We use Scripsit a lot, VisiCalc just some of the time. We are in the process of putting together a "law" theme. The theme is supported, at present, by only two articles. It should appear a few months from now. —Ed.

Please relay to Mr. Ralph G. White that I think his "Tic Tac Toe" program in your February 1982 issue is great! I learned more about string packing from copying his program than from any previous example I had ever seen. The game is fun to play too.

I deleted lines 1224 and 1274 as they seemed to serve no purpose. I added another B\$ in the first print address of line 1560; that cleans the screen better. I modified the two endings to provide a "permanent" blinking statement of who won. I have to hit BREAK to play again.

Of the several computer magazines I read regularly, yours is the best for a TRS-80 owner. I copy most of your Fun 'N Games features and never fail to learn new programming techniques from them.

**William B. Oaks
Renton, WA**

...Please pass the following on to Bob Liddil as it concerns the *Book of BASIC Adventures*. I have two of the programs running on the Color Computer (which takes some doing since the 16K Color Computer with Extended BASIC has approximately 700 fewer bytes available for BASIC program storage than the 16K Model I with level II). The first program I attacked was Lost Dutchman's Gold. The problem concerns line 2060 which goes to a NEW command if the player does not want another game. The NEW command is ok when included in commercial software, but it can wipe out a program which was laboriously keyed in and debugged. If you haven't already, you may be getting some irate letters and a word of caution to book purchasers might be in order. Incidentally, although I haven't tried it, you could probably recover such a lost program by peeking through the program in the command mode to find the two end-of-program zeros and then poking the address of the next byte into memory locations 27 and 28 on the Color Computer and whatever the equivalent addresses are for other machines.

**Bob Roberts
Lancaster, OH**

Your advice is certainly well

taken. It can be frustrating to lose hours of work, but by now everyone must know the meaning of the NEW command and not put that line into the program until it is totally debugged and ready to save. —Ed.

I got your January 1982 issue today — what a start for '82 — congratulations! I have never read a magazine with so much useful information.

I am a small businessman attempting to pay all the bills and employ the smallest number of staff, i.e., doing everything myself and going mad trying. I bought a computer two years ago and find it a great hobby — time permitting, maybe getting the computer to do the bookwork would give me more time to play with the computer! I do not think I am alone with this problem, and the 12-column ledger program (*in 80-U.S., Jan 82*) has given me great hope for the future. All I need now is the time to enter it (and convert to MX-80 codes). One point however, could you *please* print regularly how us readers can tell when our subscription is due? I dimly remember from an old issue it has to do with the number code on the label? or is your new addressing service sending reminders? I do not wish to miss a single (monthly!!) issue now.

**Will Teasel
Tenterden, Kent, England**

It's nice to see that computers have become a mind-expanding hobby for you too. As for the expiration code our subscription fulfillment service uses, here is an explanation:

123456 03 8301
JONES, JOHN D

The first number above the name is an in-house sequence number which identifies you. The second, two-digit number is the number of that issue, i.e., 03 is for the March issue. The third group of four digits is your expiration issue, i.e., 8301 would indicate that the January 1983 issue is the last of your subscription. Along with all this, of course, we always encourage everyone to renew early because it saves loads of paperwork. I hope this helps, and am glad you enjoy the magazine. —Ed.

My hat is off to Alan Simon for his article, Menu-80, in the March 1982 issue. For LDOS users (*here*) is one small change for line 130:

```
130 D=PEEK(15388)—48
```

The program will now see the right drive number on the screen. And I added a short subroutine so I could put this program on my system disk in drive 0 and select the menu from any drive:

```
80 DIMA(26):GOSUB350
350 REM EDIT LINE 380 FOR
TOTAL NUMBER OF DRIVES
360 PRINT@530,"SELECT
DRIVE MENU — ";
370 X$=INKEY$:IFX$=""THEN
GOTO 370
375 X=VAL(X$)
380 IFX< 0 OR X >1 THEN
PRINT@ 594,"NO SUCH DRIVE!":
GOTO 360
390 CLS
400 ONX+1GOTO410,420,430,440
410 CMD"DIR :0":RETURN
420 CMD"DIR :1":RETURN
430 CMD"DIR :2":RETURN
440 CMD"DIR :3":RETURN
```

and just one more modification for those who change their minds:

```
275 PRINT@773,"Z) TO SELECT
ANOTHER MENU — ";
285 IFV="Z"THEN GOTO 60
```

Thanks for letting me share this with your readers, and thanks to you at 80-U.S. for the fine magazine you publish.

**John Gunsett
San Pedro, CA**

And thank you John, for the good information you have given here. — Ed.

...Please pass on to Spencer Hall that my experience with the Stringy Floppy parallels his except mine ran 100% from start up and is absolutely a thrill to use. I guess I'm a satisfied user as I've purchased a number of other Exatron software items including the FMS program (a super file handling program) and the ESOS 2.4 (a slow disk simulator for stringy which has a number of powerful intrinsic routines such as renumber commands, merge, sound

frequency and duration generator, lower case, and screen dump plus more, all for \$35.00! I, too, simply use cassette for archival copies and my only problem with Stringy is running out of wafers!

While I'm at it I would like to comment on the new monthly format. I find myself unable to absorb all of this material on a monthly basis. Bimonthly was fine for my needs. More often than not I return to back issues to refamiliarize myself with the contents and something new will pop out...

**Tim Bowman
Spokane, WA**

Sounds like the Stringy is indeed an @SUCCESS. Loading and saving at 7200 baud is a real step up after audio cassettes. — Ed.

...As a retired person from 25 years as Director of Research for *Modern Medicine* (Minneapolis, MN) a publisher of medical journals, I get a real kick out of reading your vagaries of a growing advertising publication. We experienced many of the problems you are meeting. And I do find your editors selection and handling of articles most helpful in my current microcomputer hobby. Just keep on experimenting and changing — but don't change too much and too fast.

**Al Hubbard
Ft. Myers, FL**

We have been pulling ourselves up by the bootstraps for some time now and enjoy doing it as much as you enjoy watching it! There are many improvements to come; so many in fact, that it sometimes boggles the mind thinking of them. Will it all end with "electronic mail"? We don't know, but it's sure fun trying to anticipate and speculate. As far as going too far to fast: When you start from zero you sometimes need to double up to catch up. — Ed.

The January 1982 issue of your journal is the first that I have seen and bought. I am entranced with the concept of listing variations in programs to fit the different TRS models. I own a Color Computer (16K Extended BASIC).

Spencer Hall's article has a typical error in subroutine 42 — erase contents of box drawn by 41 but leaves the box. You always have to restore the end of the line erased

and whatever follows. The simplest change I could make without disturbing the original numbering system was:

- a) delete line 118
- b) change line 41 to: 41 GOSUB 115: GOTO 143
- c) change line 42 to: 42(original line): GOTO 119
- d) add line 143: 143 PRINT@PZ, ZT\$;:GOTO 119

I am disappointed that the Fun 'n Games, Hog Jowl Mansion, will not work on my 16K Color Computer.

The article on expanding Color Computer memory by R. Wayne Day was perfect.

How about a program for joining two or more programs from cassette? How about a subroutine for changing the position of a program line? These are the two things that I need the most at the moment (or a cassette editor).

**Joseph P. Laronda
Cheshire, CT**

Hang in there. The routines you want will probably show up shortly and we will report on them as they do. — Ed.

Thanks for your recent assistance (and courtesy) when I called for some subscription information. I have received my first issue and am very pleased.

There are a lot of us Color Computer rookies out here who need all the help we can get. Your articles are helpful and program listings for the Color Computer are really appreciated. The more, the better. Good information for this machine is still a bit scarce.

Something that would be very helpful to many of us would be information pertaining to limited, inexpensive systems. For instance, in your recent word processing articles, a fine product that would have been appropriate is C. C. Writer. It is a very low cost, cassette word processing program written in BASIC — it doesn't require disk, is user modifiable, and in general a terrific little package for a small system.

Also, it's great that you have gone to a monthly. I hardly have time to digest all that info in one month, but it is fun trying.

**Gary Burkhardt
May, 1982 7**

Items at random

It's May, and spring has finally sprung. The proofreaders have just finished proofing this issue and have walked away shaking their heads and saying that if we keep this up we might have a magazine! Their attention to detail is amazing, but they still miss a few now and then. Corrections to previous issues follow.

Corrections

In the March issue we published a short program and article called "Clean those disk heads". The listing allows the disk drives to continue rotating during the entire cleaning process. The program will not work on the Model III because disk drive operations require input and output to a port address as opposed to a memory location as on the Model I. Listing 1, below, will allow Model III users to accomplish the same disk cleaning task. Our thanks to Robert E. Brown of Schenectady, New York, for this input.

Also in the March 1982 issue, page 48 contained an article "Laying it on the line" and has a flaw in the listing. Lines 110 and 120 should read:

```
110 NEXT Y2
120 NEXT X1
```

instead of:

```
110 NEXT Y1
120 NEXT X2
```

As printed, the listing will give you a NF? error.

The text pertaining to the "Payback" program listing on page 30 of our April 1982 issue has a error. Specifically, the third paragraph should read:

"Payback will neither strain your machine's memory (it runs in less than 700 bytes) nor wear out your typing fingers (only 14 program lines). It runs on all models. For Model II, change CHR\$(243) in line 50 to SPC(67).)Ed. Note — For Model II, also remove the :PRINT@64, CHR\$(31) in line 150." It seems we renumbered the program after the text had been edited and line number references no longer corresponded. We are sorry if this caused you a problem.

Reader survey

If you haven't yet completed the reader survey in the April issue, please do so soon. We are anxious to tabulate the results. Your answers will determine, to a large extent, the direction and content of this publication. Although we like to improve and fine tune the production, the editorial content should be dictated mostly by you, the readers.

In this issue

The theme of this issue is space. Our cover artist, Thomas Scott Nelson, did a wonderful job with Saturn. This is his second cover for us (the first was in March 1982). We found it very interesting that the Jet Propulsion Labs were using a TRS-80. Harry Avant wrote the lead story, and it appears on page 16.

With all the hoopla of the world coming to an end in March (we didn't believe it either), Terry Dettmann wrote a planet location program for the Color Computer. It gives the date and the relative angular position of the nine planets. It is a very interesting program to watch, and no, the planets did not line up in March. You can see it for yourself.

Finding where the satellites are is the subject of an article by Dana Waldman and Mark Felton on page 19. Let's see — if you point your antenna properly, you might get foreign television broadcasts (and reruns of "I Love Lucy").

Yes, Delmer, we finally found a home for your article, "Spaceship Orbitor". Delmer Hinrichs submitted this article so long ago I blush in thinking about it. We finally found an issue into which we could fit it. Not just another Lunar Lander, this program has all the realistic aspects of a real landing on four different satellites or the planet Mars. You have to be good, and learning to land on one of them does not guarantee a safe landing on another. It's tough, but also fun.

Solving simultaneous linear equations is the subject of an article and program by J. C. Adams, Jr., Ph.D., on page 34. It is always nice to see the computer take the grunt work out of math, and this article does it well.

Fred Blechman presents a small business invoice program on page 42. His program earlier this year, on a 12-column ledger, has drawn considerable interest and we are sure this one will too.

There is more too, see the table of contents. We hope you find it as interesting as we did. Make your days good ones, and tell everyone that you saw it in *80-U.S. Journal*.

Mike

HAPPINESS IS...NEWSSCRIPT™

THE WORD PROCESSOR FOR BUSINESSMEN AND PROFESSIONALS

We offer you ongoing support by answering your questions and providing reasonably priced enhancements.

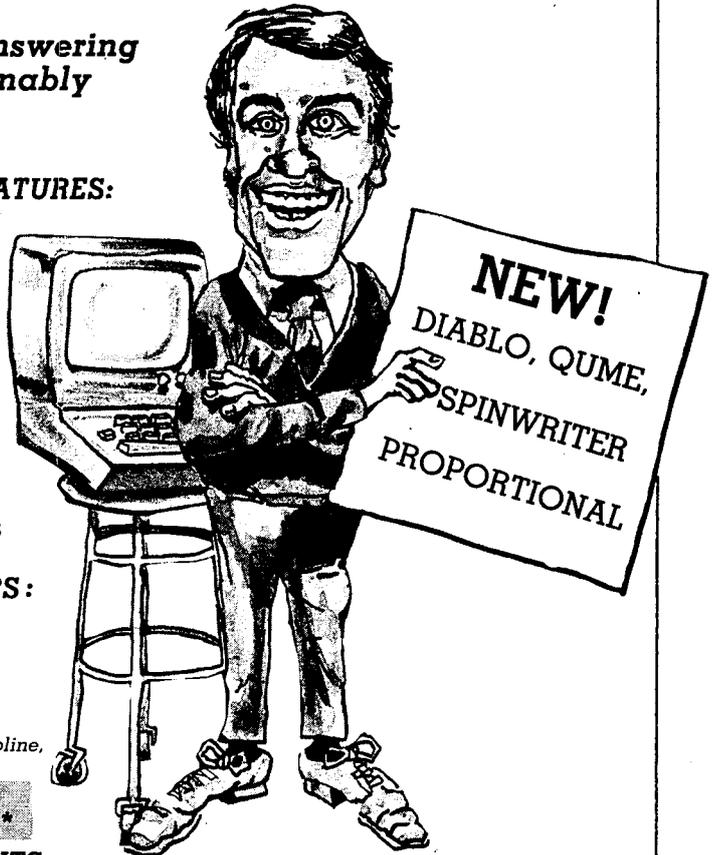

A FEW OF NEWSSCRIPT'S STANDARD FEATURES:

- *Form Letters with merging of names and addresses
- *Gives superb appearance to your final documents
- *Comprehensive manual with hundreds of examples
- *Centering, top/bottom titles, indents, pagination
- *Underlining, boldface, double-width, italics†
- *Sub-scripts, super-scripts, proportional pitch†
- *Generates Table of Contents, sorted Index
- *Allows block graphics, special symbols†
- *Search and replace globally or within a range
- *Block move, copy, delete, insert from other file
- *AUTOSAVE, WHOOPS, DIRECTORY, KILL, REPEAT
- *Based on IBM's "EDGAR" and "SCRIPT" systems
- *Supplied ready-to-run on "tiny" DOSPLUS
- *Easily transferred to NEWDOS, NEWDOS/80, LDOS, TRSDOS
- *Includes handy Quick Reference Card

NEWSSCRIPT CONTROLS THESE PRINTERS:

- *EPSON MX-80, MX-100: all 12 fonts, plus underlining and block graphics; italics with GRAFTRAX
- *Centronics 737, 739; Radio Shack L.P. IV, L.P. VIII, Prowriter, Daisy Wheel II, NEC PC-8023A, TEC 8500R, C.I.TOH 8510: Right-justified true proportional printing
- *Good support for: Diablo, Spinwriter, Starwriter, QUME, Microline, Anadex, modified Selectric, standard line printers

NOW AVAILABLE: right-justified true proportional support for Diablo, Spinwriter, Starwriter, and Qume (DaisyWheel Option)**

TYPICAL USER AND REVIEWER COMMENTS:

"There is a new word processor on the market that will change the way people think about the capabilities of the TRS-80. Imagine a powerful mainframe text editor running on a TRS-80, with virtual compatibility between the two versions...on-going support second to none, with superb documentation." (Jim Klaproth, 80-U.S. JOURNAL February, 1982)

the manual:

"It definitely rates the first '10' given to any documentation reviewed in this column." (A.A. Wicks, COMPUTRONICS, October, 1981)

the software: "An excellent Word Processor" (D.H.); "Absolutely fantastic" (S.E.S.); "You have features that I cannot duplicate on my \$14,000 system" (J.B.)

the support: "Your phone information system and the prompt and courteous staff that you provide to help your clients...are worth the cost of the system." (V.H.H.)

REQUIRED CONFIGURATION: 48K TRS-80 with one disk drive. Specify Model I or Model III.

† Some features work only if your printer has the mechanical capability.

** DaisyWheel proportional is extra-cost option.

**DEFENSE
COMMAND**

By Hogue & Konyu from Big Five
You are the lone defender of 10 Krotnium fuel cells essential for the survival of the planet. Aliens swoop down from above to steal the fuel; it's your job to destroy them. You can still save the cells after a raid, but you must shoot the alien and simultaneously move under the cell to catch it. If things look bad you can set off one of your 4 antimatter bombs and destroy all enemies on the screen!

16K tape...\$15.95 32K disk...\$19.95

ELIMINATOR

By Westmoreland & Gilman from A.I.
You'll need all your keyboard manipulative skills to keep up with the action in this arcade game. You travel across the planet's low-altitude airspace in an effort to prevent the marauding enemy from capturing your energizer cells. All manner of alien craft await your arrival with destructive forces. For 1 or 2 players, with sound.

32K disk...\$24.95

**ALIEN
DEFENSE**

By Larry Ashmun from Soft Sector
Piloting your ship across the horizontally moving terrain, you must battle the various enemy spacecraft. You are under attack almost constantly, and to make matters worse, your ground patrol people are being picked up by the alien landers. To save them, you must shoot the landers and "catch" the falling man. This fast action game requires skill and rapid reflexes. The model III version uses that model's special graphic features.

**Instant Search/Sort
DATABASE**

By G. Hatton from Acorn
An easy-to-use, yet powerful database management tool, ISS alleviates many of the complications usually found in setting up and maintaining information files. Written in machine language, ISS can provide a multitude of sorts, subsorts, searches and categorizations in seconds. Because the processing is done in memory, you can manipulate the data at will without risk to your database on tape or disk. The number of records is limited only by your file format and the amount of RAM in your system.

16K tape or 32K disk...\$49.95

**MONEY
MANAGER**

By Andrew P. Bartorillo from Acorn
A complete management tool for the home budget, it accurately keeps track of your checkbook and provides an easy method of budget allocation. You can store information on up to 100 checkbook entries per month (250 with 48K), specify any automatic withdrawals, keep records of tax-deductibles, and record expenses by category. You can even break up charge account payments into the proper categories.

32K disk...\$39.95

**Data File
Programming**

By Finkel & Brown from Wiley & Sons
This self-teaching guidebook, written in clear, non-technical language, leads you at your own pace through the intricacies of data file programming and maintenance. Once learned, data file manipulation is the key to virtually all programming in the business and classroom environment. The book helps you set objectives and self-tests you on your progress toward them.

LDOS	LDOS	LDOS							
LDOS	LDOS	LDOS							
S	LDOS								
OS	LDOS								
DOS	LDOS								

From Lobo

"...LDOS is by far the best disk operating system for the Model I TRS-80."

Paul Wiener,
June 80-MICROCOMPUTING

"...if you are a serious programmer, you should have LDOS."

George Blank, Editorial Director
September CREATIVE COMPUTING

A totally new and advanced operating system that offers benefits to everyone from novice to advanced system programmers. LDOS comes with one of the most complete and well written documentation books ever, with easy-to-follow instructions to get started plus a wealth of supporting information for when you need it. This, plus a toll-free customer service number means that LDOS supports you as no one has before!

Completely device independent, LDOS provides for routing, linking, setting, and filtering of the input/output of a number of peripherals. Up to eight disk drives are supported in almost any mixture: 5", 8", single/double density, up to 80 tracks, even hard disks.

"Job Control" can end the tedium of repetitive keystrokes needed to call up and manipulate programs. Once you tell LDOS what it needs to do to get you up and running, it executes the series thereafter with a simple command. And LDOS notes the date all files were created or modified -- even flagging files that haven't been backed-up after modification.

We've just scratched the surface of LDOS' capabilities, and we'll gladly send you a pamphlet that goes into more detail. But better yet, order LDOS now and begin enjoying the power that this system will bring to your computer use.

Micro Yellow Pages

Micro Yellow Pages is a 32-page software directory/newsletter describing over 50 business software packages by Micro Architect Inc.

Micro Yellow Pages had the first official issue dated September, 1978. The current issue describes several new packages for the IBM Personal Computer. For a complimentary copy of this newsletter, which features information on data base managers, inventory control and complete business systems, contact Micro Architect Inc., 96 Dothan St., Arlington, MA 02174. For immediate response, send a #10, self addressed, stamped (37 cents), envelope. Or,

Circle #126

New Color Computer game

Circus Adventure, for the Color Computer is a game which provides a pleasant and positive approach to introducing children to the computer. The game runs on the 16K Color Computer. No extended BASIC or joysticks are required. It sells for \$10. from Computer Island, 227 Hampton Green, Richmond, NY 10312

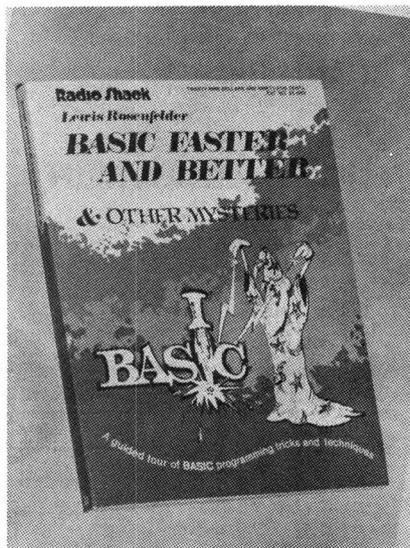

Circle #129

Radio Shack adds BASIC Faster and Better to library

Radio Shack now offers programmers of the Model I, II and III a comprehensive volume of advanced information on techni-

ques for effective and efficient programming in BASIC. BASIC Faster and Better & Other Mysteries (62-1002) by Lewis Rosenfelder, is available for \$29.95 at Radio Shack Computer Centers, stores and participating dealers.

The author, a recognized programming authority, reveals innumerable short cuts, secrets, bits of what the author calls "trickery" and helpful hints for high efficiency, plus other advanced programming techniques. He offers extensive information on many topics, including shell programs, USR routines, "magic" arrays, strings, searches and sorts, utilities, number crunching, overlays, bit manipulation, memory mischief and more. In addition, a number of useful tables and listings have been incorporated into 11 appendices to this huge (8½ x 11 inch, just under 300 page) reference, and an extensive subject index has been provided.

Model III Hi-res

The Grafyx Solution gives any configuration of a TRS-80 Model III a resolution of 512 x 192 for a total of 98,304 individually accessible points. The included graphics package allows you to set and reset points, lines, rectangles, and complement or clear the screen using simple BASIC commands such as PLOT and LINE. Alternate resolutions of 256 x 192, 128 x 192 or 128 x 96 are also possible.

When enabled, the hi-res graphics screen is displayed on top of the normal character display. The Grafyx Solution is an add-on circuit board which contains 12,288 bytes of additional read/write memory that does not conflict with the TRS-80 address space. Upgrading your computer requires no soldering and is as easy as clipping on some micro-clips, cutting one trace and removing two IC's from sockets.

Available for immediate delivery upon the receipt of a check or COD request for \$299.95. Micro-Labs, Inc., 902 Pinecrest, Richardson, TX 75080 (214) 235-0915.

New word processor

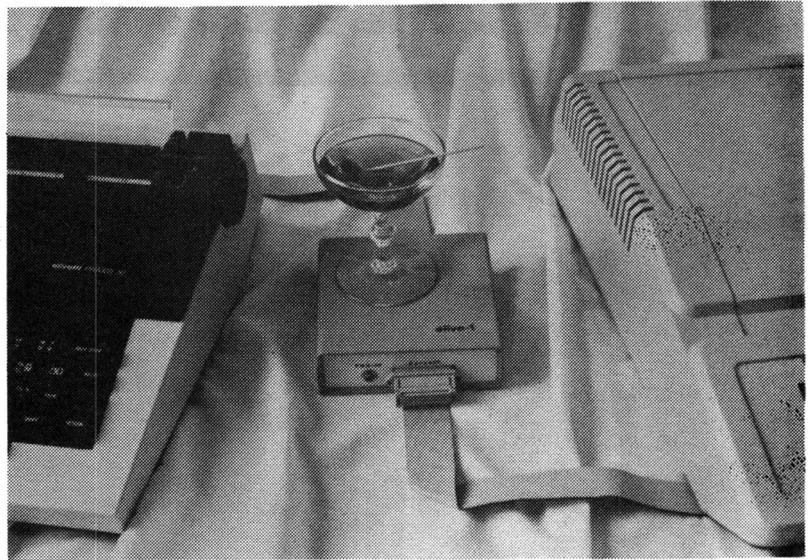

Transformation Technologies has announced its C. C. Writer word processing program for the TRS-80 Color Computer and the Radio Shack or Exatron disk systems. Disk C. C. Writer retains all of the features of the popular cassette C. C. Writer program plus adds features made possible by disk. Disk CCW allows full control of the margins, page length, line spacing, centering, justification and most features of "smart" printers. The powerful editing features allow changes, insertions, deletions and moves anywhere in the text. Files may be chained together for extended printing. Disk C. C. Writer requires 32K, Extended BASIC, and one Radio Shack or Exatron disk drive. Disk C. C. Writer is \$40 from TransTek, 194 Lockwood, Bloomington, IL 60108

Circle #132

Daisy wheel printer under \$700

Model Olive-1 Interface turns Olivetti Praxis-30 or -35 electronic daisy wheel typewriter into letter quality printer with RS-232C computer interface. The Model Olive-1 Interface is available completely assembled and tested, with interface cables and detailed instructions for attachment to Praxis-3X, typewriter function is unimpaired, priced below \$200; 9 VCC/300 ma wall socket plug-in power supply is optional. The Model Olive-80 Printer Package, including the Praxis-30 and Olive-1 Interface plus full documentation, is priced below \$700. The package with the Praxis-35 is slightly higher. For more information contact The Olive Branch Association, Ltd., 1426 W. Winton Ave., Hayward, CA 94545 (415) 887-4716

Circle #130

Pocket Computer interface

With the Protean Scientific PTR Interface you can now use the TRS-80 Pocket Computer as a portable data logging device and transfer your data quickly and easily to a TRS-80 desktop unit.

The complete PTR package is being introduced at \$99.95 plus \$2.50 shipping and handling. To order or for more information contact Protean Scientific, Route 13, Lincoln, NE 68527

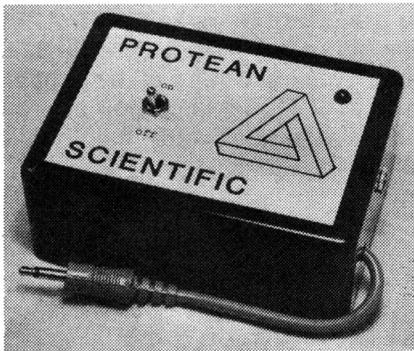

Circle #131

New coupon shopping program

Softbyte Computing has organized a way of keeping records of redeemable coupons. Up to 99 coupons, their brand names, values and expiry dates can be stored.

A stored list of 160 grocery items (more can be added) is available and shopping lists from these and a symbol next to items having a coupon will appear. The program will total up coupon deductions. Available on cassette for TRS-80 Model I and III for \$9.95 from Softbyte Computing, PO Box 217, Wallingford, CT 06492

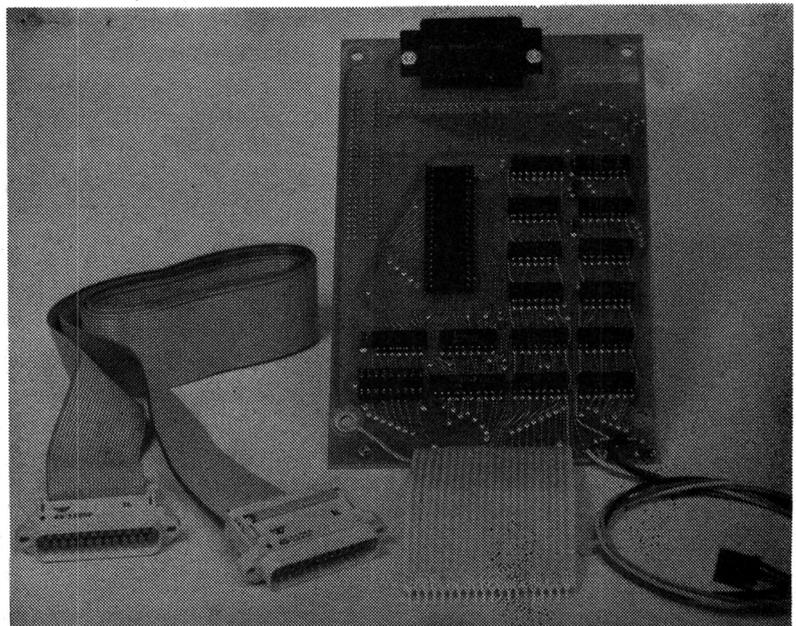

Circle #128

New RS232C Interface

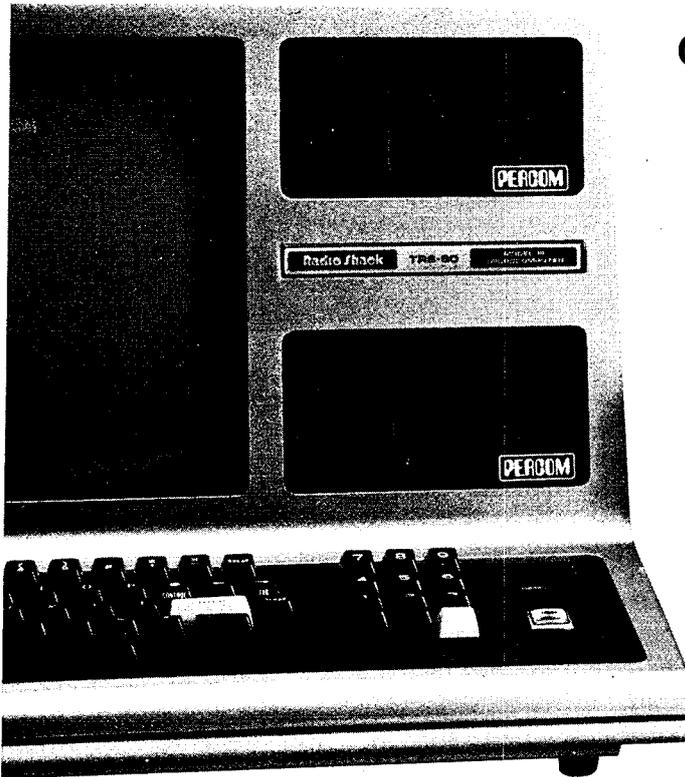

VR Data is proud to announce the availability of the VR-RS232C. The VR-RS232C is a plug-compatible serial interface for the TRS-80 Model III. It features a programmable baud rate generator from 50 to 19,200 baud, fully interrupt driven, programmable pin out to eliminate special cables (modem output standard), reverse polarity protection, programmable UART, user prototyping area for special applications such as 20 ma current loop, relays or lamp drivers. Internal installation can be made with simple hand tools. No soldering or other component level work is required. Retail price is \$75.00. VR Data Corp., 777 Henderson Blvd., N-6, Folcroft Industrial Park, Folcroft, PA 19032 (215) 461-5300

Circle #127

GREATER VALUES

New Low Prices for Percom Model III Disk Drives!

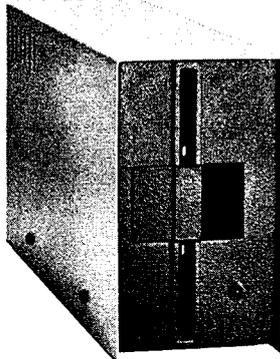

Complete First-Drive Systems
from **\$449**

Internally mounted drives that feature double- or single-density storage, comprehensive pre-delivery testing, 48-hour burn-in and, best of all, Percom's widely acclaimed disk controller. A First-Drive System includes the four-drive disk controller, one or two drives, power supplies, cables and a fully illustrated owners manual. Use Model III TRSDOS*, Percom OS-80+ and all other Model III compatible DOSs.

Note: If you prefer not to make the First-Drive System installation, we'll do it for only \$29.95 plus shipping. This includes a 48-hour operating burn-in of your Model III computer, installation of the drive system and final checkout of the expanded system.

Our Own Fully Tested Drives from only \$275

- Every Access Floppy Disk drive is electrically tested, mechanically tested and burned-in 48 hours under operating conditions. Look for the signed test list in the shipping carton.
- AFD drives are capable of either single- or double-density operation. Store up to 364 Kbytes (formatted) in double density. Store twice the data on a single diskette using AFD "floppy" drives."
- 15-day free trial offer...comprehensive 90-day limited warranty...unbeatable prices...AFD-100 @ \$275.00, -100F @ \$329.00, -200 @ \$429.95, -200F @ \$449.95.

How to order—Order by calling Access Unlimited toll-free on 1-800-527-3475. Or order by mail. Orders may be charged to a VISA or Master Card account, or paid by cashier's check, certified check or money order. COD orders require 25% deposit. Sorry, we cannot accept personal checks. We pay freight (surface only) and insurance charges for shipments in U.S. on orders over \$1,000.00. Add approximate insurance and shipping charges for orders under \$1,000.00. If in doubt about these charges, ask when you call in your order. Texas residents include 5% sales tax. Minimum mail order \$20.00. Allow 2 to 4 weeks for delivery.

Jet Propulsion Laboratories uses TRS-80 interface to photodensitometer

Harry Avant, La Crescenta, CA

This article describes a hardware interface that is currently being used in the Mission and Test Photo System of the Jet Propulsion Lab in Pasadena, California. A TRS-80 microcomputer is used in conjunction with the hardware described to acquire, store and manipulate photographic density and temperature data in a high volume photographic processing facility. The data is generated in conjunction with the production of photographic images from unmanned interplanetary spacecraft such as Voyager. The interface provides for 24 bits of I/O that can be expanded to 96 bits if required.

Introduction

During the past two or three years, small "personal" type computers have been utilized in increasing numbers within large industrial-type environments. One of the more common applications for these types of computers is in the area of equipment and process control.

This article describes an interface that is currently used to couple photographic densitometers and a temperature indicator to a TRS-80. A view of the equipment is shown in photograph 1.

Attached to the TRS-80 are the following: two densitometers (only one is shown in this view), a second monitor, three disk drives, one

cassette recorder, a Radio Shack Line Printer II, an Axiom 801P printer, a Micromint I/O port with parallel and 232C ports, a Micromint Digitalker, constant voltage transformer, line spike suppressor, and finally, the interface that is described in this article. This interface is the long box just above the TRS-80 monitor. At first glance, it appears that we have made an effort to see just how many things can be attached to a TRS-80, but each of the items is extensively used on a daily basis.

This equipment is located within the Mission and Test Photo System (MTPS) group of the Photo Lab located at the Jet Propulsion Laboratory in Pasadena, California. The Mission and Test Photo System is a high volume photographic processing facility dedicated to the production of black and white photo products from unmanned interplanetary experiments. Products produced by the MTPS are used for scientific investigations, which places stringent requirements on the facility to maintain very high standards in terms of quality control.

The MTPS produces 5 by 5 inch film (both negatives and positives), 5 by 5 inch contact prints, and 10 by 10 inch enlargements. This facility is capable, over short periods, of producing up to 65,000 pieces per week, although 35,000 per week is

more typical. In addition to production requirements, MTPS also assists in the calibration of digital film recorders that convert data to photographic film.

In order to adequately monitor quality of the items produced, huge amounts of data are acquired. As an example, during the recent Voyager exploration of Jupiter, more than 15,000 density measurements were made on various tests, and chemical process monitoring. (Density as used here refers to photographic density which is a measurement of how dark a photographic image is. The instrument used to measure density is called a densitometer.) These measurements were made over a period of sixteen months in conjunction with production of 800,000 of the photographic products described above. When faced with 30,000 numbers to describe the quality of 800,000 products, a computer becomes very necessary!

Background

Prior to 1977, data from various measurements was being hand copied onto pre-printed forms which were stored by category in three-ring notebooks—many notebooks, I might add. In order to utilize the data, it was necessary to enter it into conventional calculators for computations. Not only was this very slow, but offered the chance for error both in entering data into the

notebook records, and reentering it into a calculator.

In an attempt to partially automate some calculations, a dumb terminal communicating with a very large main frame computer was utilized. Data from notebook records was entered into a data base resident in the main frame. This was some improvement in that the data base was able to perform complex sorting and limited statistical analysis.

As anyone who has ever had to contend with time sharing on a large system knows, access was not always possible. Many times when data was needed in a hurry, it was necessary to wait to gain access. In addition, a very large computer's time is not inexpensive. We soon discovered that on-line terminal time per year could easily cost more than a small stand-alone computer system. A main frame was not helping with the problem of human errors, either. There was still the occurrence of erroneous entries into notebooks and more errors in reading notebook data and entering it into the computer.

Our next consideration was the possibility of interfacing some measuring equipment directly to the main frame. This was rejected, based on hardware cost of interfacing equipment. There was still the problem of access to the main frame.

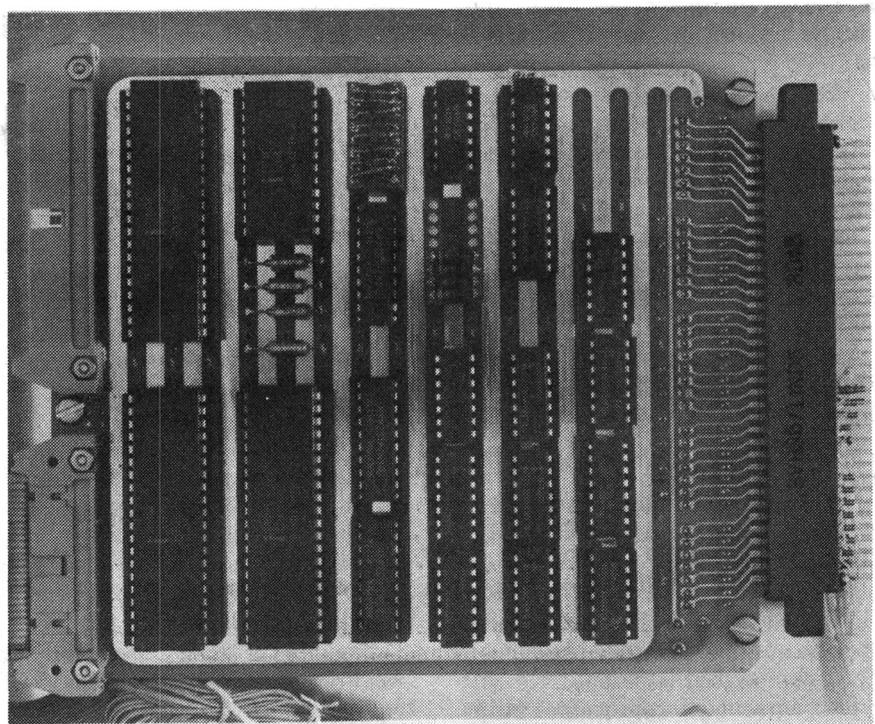

We considered the possibility of acquiring a small computer, interfacing it with some measurement equipment and storing data on disk or tape for later transmission to the main frame through modem. An investigation of probable costs, again, of using a large computer to store and manipulate data, lead us to the decision to do it all with a small computer.

A 48K two disk TRS-80 Model I was purchased by the lab and training of quality control personnel in BASIC language programming began. A simple prototype interface, using an 8255 programmable interface chip, was constructed as well as a "densitometer simulator." The prototype seemed to function quite well and it was installed in the lab for a couple of weeks to determine how well the TRS-80 and its

Overview of the equipment setup in the MTPS. Photograph provided through the courtesy of the Jet Propulsion Laboratory, California Institute of Technology, Pasadena, California.

Photo 1

Detail photograph of main circuit board in interface. Photograph provided through the courtesy of the Jet Propulsion Laboratory, California Institute of Technology, Pasadena, California.

Photo 2

interface would perform. Since there were no problems encountered, the design and construction of a final version of the interface was initiated.

Photo 2 shows the parts layout of the main board. Currently, this interface is being used in conjunction with two photographic densitometers and an eight-channel digital temperature indicator. One of the densitometers is a MacBeth model TD504 transmission type and the other is a MacBeth model TR527 reflection type. Both of these are digital readout instruments utilizing three, seven-segment numerical displays each, and equipped with BCD digital outputs on their rear panels. An interesting feature of the BCD outputs is that they are negative logic—a (one) is false, and a (zero) is true.

Each densitometer is equipped with a nine-column printer to provide hard copy records of measured density. The nine-column printers are designed to accept BCD data and are directly coupled to the output of each densitometer with no external interface. The digital temperature meter is a four-digit liquid crystal display equipped to handle eight temperature sensors.

There are seven high speed film and paper processors in the lab. Each one is monitored by a separate sensor, with one sensor unused. This meter also has BCD information brought out to the rear panel. In addition, the temperature indicator is multiplexed by a three-bit "word" to allow it to read any of the eight temperature sensors. Sensor selection may also be controlled by a front panel switch on the meter.

Hardware Description

Three 8255A programmable interface chips provide the heart of the circuit. Although the 8255 was designed with the 8080 microprocessor in mind, it is a general purpose I/O device that is compatible with most current microprocessor chips. An 8255 provides 24 I/O lines that may be configured in various groupings by supplying an appropriate control word. Four ports are available as I/O for this device, two with eight bits each, and two with four bits each.

Independent port programming is accomplished by choice of the control word used.

Intel, the designer of this device, publishes an excellent application and data sheet, Application Note AP-15, "8255A Programmable Peripheral Interface Application." As stated in the application note, it is possible to program the device as three independent ports, as well as several other useful configurations by proper choice of the control word used. In this application, a control word (155 decimal) is used to configure the chip's three, eight-bit ports as input only, with each port operating independently of the others.

The 8255 chips are memory mapped into a region of two thousand bytes of unused memory locations which start at 12288 (3000

At first glance, it appears that we have made an effort to see just how many things can be attached to a TRS-80, but each of the items is extensively used on a daily basis.

Hex) in a Model I. Memory mapped addressing was selected because it allows for a very large number of locations to be used and does not interfere with some of the port addressed devices that are also used with this particular configuration.

Software

A complete discussion of the software used in conjunction with this interface is well beyond the scope of this article. What follows is a brief outline of the drivers used for programming the 8255s and converting the BCD data into binary form. A typical input and its conversion follows.

Assume that a densitometer reading of 3.45 occurs. The BCD equivalent of this reading is:

0011 0100 0101

However, the densitometer has negative true logic which results in:

1100 1011 1010

Considering the first two digits, 3 and 4, the 1100 1011 is equal to decimal 203, NOT $203 + 256 = 52$,

which in binary is:

0011 0100

AND with 15 (binary 0000 1111)

then:

0011 1111 AND

0000 1111

result 0000 0100, or 4 in decimal, which is the middle digit.

Now, take the binary 52, and AND it with 240. We get:

0011 0100 AND

0000 1111

result 0011 0000, or 48, in decimal. If this is divided by 16, the result is 3, which is the leading digit. The most significant and middle digit has now been recovered. For the least significant digit:

0101 xxxx in binary

1010 0000 in negative true

This is equal to 160. A NOT(160) is equal to -161, and adding 256, equals 95, which in binary is:

0101 1111

This is ANDed with 240 as follows:

0101 1111 AND

1111 0000

result: 0101 0000, which is equal to 80 decimal. This is divided by sixteen to compensate for the positional factor, resulting in 5, which is the least significant digit of the original reading.

Acknowledgements

I would like to acknowledge the assistance of the following: Mr. E. T. Lee, Photo Electronic Technician (MTPS), for his help in construction of the interface; Mr. D. J. Lee, Photo Quality Analyst (MTPS), who took the hardware and the simple software driver I supplied with it and integrated them into the overall MTPS software routines; and Mr. G. A. Praver (JPL), former Group Supervisor (MTPS), for his encouragement and foresight during all phases of this effort.

The research described in this paper was carried out by the Jet Propulsion Laboratory, California Institute of Technology, under a contract with the National Aeronautics and Space Administration.

Geosynchronous satellite pointing

Use spherical geometry to locate satellites

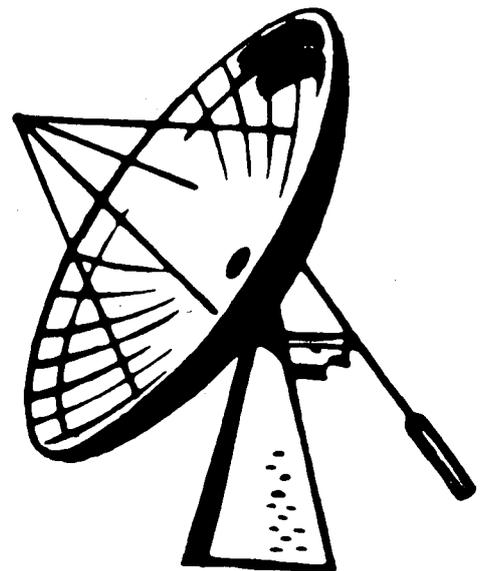

Dana Waldman and Mark Felton, Denver, CO

A major portion of the satellites that are used today sit in an orbit over the equator some 22,214 miles from earth. The reason for this orbital path is that satellites placed in this "geosynchronous" orbit will revolve with the earth, and therefore, remain continuously over the same spot on the earth. This fixed orbit makes pointing much easier, with no need to track the satellite. The telescope or antenna can be pointed only once, then locked into place.

For those involved in either amateur or professional antenna or telescope work, the question still remains, "How does one find the various geosynchronous satellites?" The program in this article was developed on a TRS-80 Model I using BASIC Level II and TRS-DOS. It uses spherical geometry to locate the "geosynchronous" satellites over the contiguous United States. It allows entry of up to 20 satellites and their longitudes into a satellite data file. The program uses this information to calculate the direction (azimuth)

and elevation angle from the ground that the antenna or telescope should point to find the satellite. A list of satellites and their longitudes (west) in degrees are given below.

Satellite	Longitude
Comstar 1	128
Comstar 2	95
Comstar 3	87
Satcom 1	135
Satcom 2	119
Satcom 3R	131
Westar 1	99
Westar 2	123.5
Westar 3	91
Anik 1	104
Anik 2	109
Anik 3	114

Feature program

This program allows satellites to be added or changed to handle future changes in orbit.

Since the program requires the longitude and latitude coordinates of the location on the earth to tell how to point the antenna, you will need a source of longitudes and latitudes for the locations of interest. Most public libraries have an atlas which will give you the necessary information.

In addition, the program asks for the declination angle of your location. Declination angle corrects for the difference (slight) between the true North Pole (the northern point of the spin axis of the earth) and the magnetic North Pole (the place where a compass points when it says "north"). This angle can be obtained by calling the closest airport or a local surveyor.

The magnetic azimuth is the direction which includes the correction of the declination angle. If the declination angle is zero, the magnetic azimuth and the true azimuth will be the same. You should use the magnetic azimuth if you are pointing at the satellite with a compass. The true azimuth may be required if you are using surveyor's maps.

The outputs of the program's calculation are the true azimuth, the magnetic (compass) azimuth and the elevation angle. Most hardware stores have an angle measuring instrument called an inclinometer if your antenna or telescope won't give you the elevation.

Mathematically, the program is based on spherical geometry. If you draw the earth as a sphere, then locate the lines from the center of the earth to any location on the earth and outward through the equator to the satellite in orbit, the required geometry begins to emerge. Now, draw a tangential plane at the earth's location, draw a line from it to the satellite. With a little bit of knowledge of spherical geometry and ability to read the basic program, you can derive the equations.

The program is interactive and easy to operate. When the program is run, the main menu appears:

**** MAIN MENU ****

1. Azimuth & Elevation Calculation
 2. Maintain Satellite Longitude Table
 3. End Program
- Enter Function

Function 1 allows the entry of data into the file "SATFIL/DAT". This file will be created on your disk if it does not exist. At the prompt: ENTER SATELLITE NAME ('END' TO EXIT), key in a name of up to 15 characters. To go back to the second menu, key in END. At the prompt: ENTER SATELLITE LONGITUDE, key in longitude, in degrees. The table will hold up to 20 satellites.

Function 2 of the second menu, displays the satellites on file. The satellites have been numbered automatically when entered. For example:

1	Westar 1	99
2	Westar 2	123.5
3	Westar 3	91
4	Satcom 1	135

WHICH SATELLITE # DO YOU WANT TO CHANGE ('0' TO EXIT).

To change the fourth satellite (Satcom 1), key in 4. The program asks for the satellite's new name and longitude, writes the new data back into the file, then redisplay the satellite table.

Now you are ready to use this data to calculate the azimuth and elevation angle. Go back to the main menu and choose Function 1. At the prompt: ENTER THE SATELLITE NAME, key in the name of the satellite at which you want to point. The program searches the satellite table for this name and, if no match is found, it will ask for the name again. When it finds the name in the file, it uses the longitude to calculate true azimuth, magnetic azimuth and elevation angle.

Here are some sample points and calculations:

Make the most of your TRS-80™ with Wiley's popular guides

Whether you're a novice programmer or an adept computer user, our inexpensive paperback guides let you exploit the full potential of your TRS-80™ micro— for work, for pleasure, and everything in-between.

TRS-80™ BASIC

Bob Albrecht, Don Inman, & Ramon Zamora

"OUTSTANDING... the best thing to happen to Level II owners."

-Computronics Monthly News

"If you're a rank beginner... your novice status won't last long. TRS-80 BASIC leads you by the hand through the maze of programming the computer to perform both entertaining and useful tasks."—**Interface Age**

"Anyone with access to the proper home computer will be able to write programs within a few days."

-Science Books and Films

(0 471 06466-1) 1980
351 pp. \$8.95

THE TRS-80™ MEANS BUSINESS

Ted G. Lewis

Written specifically for business computer users, this hands-on manual is the first guide to the best-selling Radio Shack Model II Computer. You'll discover a wide variety of applications that will turn your system into a powerful "filing cabinet"—while making your business a lot more manageable. Many ready-to-run programs are included and the most difficult aspects of file structure programming are simplified.

(0 471 08239-2) 1982

The Color Computer as a planetarium

Color Computer with 16K extended BASIC, cassette or disk

T. R. Dettmann, Associate editor

This illustration is a screen dump of the display generated with this program using a start date of 01,01,82 (January 1, 1982), an increment of 365 days, and a display of nine planets.

One of the fun things about working with the Color Computer is the graphics. Actually, they are quite easy to use.

In the way of simple introduction, we have included a program (in keeping with the theme of space articles) that displays the planets on your Color Computer.

The program will display successive positions of the planets at whatever interval you set. You can display any number of planets from one through nine. You will find though, that when you display all the planets, you can't tell one inner planet from another, since they all begin to wash out.

The program is written completely in BASIC. It illustrates a number of graphics functions: LINE, CIRCLE, DRAW, PCLS, SCREEN and PMODE.

Try typing the program into your computer and running it. It makes an interesting display including a running date displayed on the screen. (Look at lines 1040 to 1280 to see how it is done.)

To explain the program, let's look at the basic structure. After completing some necessary initialization (lines 10 — 270), the program goes to the subroutine at line 850 to display the desired planets.

Interesting routines

Interesting graphics routines are located at the following lines:

540 — displays a planet.

790 — sets up for graphics screen.
850 — master graphics display routine.
1040 — data for numeral draw commands.
1140 — displays date on screen.

It should be made clear that this program isn't an attempt to provide state of the art graphics. It is an attempt to show an interesting application.

The astronomy

There is no doubt that at least some of you are wondering how the program computes the position of the planets. Basically, the technique involves solving an equation (called Kepler's equation) and then plugging some numbers in a few standard formulae.

The subroutine at line 300 solves Kepler's equation by guessing a solution, and then using it to compute a better solution. This continues until new solutions are roughly the same as old solutions.

We have to do this because Kepler's equation can't be solved like you would an algebra problem. If you are really interested in the math, look at some of the more technical references listed at the end of this article. Otherwise, you can just forget there is any math involved and make believe there is some kind of black box which gets the planets' coordinates.

If you are really interested in the Astronomy, look at lines 60 to 140, which give the orbital elements for the planets. These are explained in

any good book on Celestial Mechanics. If you have better numbers, by all means try them. The numbers used here are about 12 years old and of fairly low accuracy. They were chosen to have enough accuracy for the graphics display.

Only a few celestial phenomena were checked against the display — mostly relations between planets in the inner solar system. It would be interesting to hear about any more detailed checks that anyone is able to do.

The techniques used here are applicable for more than just the solar system. Other celestial bodies, such as the moons of Jupiter, Earth's moon, and even satellites around the earth obey these equations.

Color Computer program

After you type and run this program there will be several prompts to reply to. The first will be for a date. You should enter a starting date that you wish the computer to use for the display of the initial planet locations. The next prompt will be for a calendar date increment. This number will tell the computer to display the planets according to the increment chosen. For example, if you enter 30 for the increment prompt, the computer will display

the planets' positions every 30 days starting with the date entered for the first prompt. The last prompt will be for the number of planets you wish displayed. As explained in this article, you may enter up to nine planets, but those closest to the sun will be more closely grouped and the graphics clarity will suffer.

When all prompts have been answered, the computer will draw the planets in their relative

positions with respect to the sun. The sun is indicated by the cross in the center of the screen. The planet closest to the sun will always be Mercury, the next Venus, then Earth, Mars, etc., according to how many planets you requested the computer to display.

The planets, in order from the sun, are: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune and Pluto. — Ed.

PROGRAMMING TOOLS FOR YOUR TRS-80™

INSTANT ASSEMBLER NOW ON DISK!

The **INSTANT ASSEMBLER** is a powerful disk or tape-based assembler and debugger for the TRS-80. Now you can assemble directly to memory and immediately debug your program with the built in single stepping debugger. Quickly switch from assembler to debugger and back again without losing the source code. This feature makes INSTANT ASSEMBLER an excellent learning tool for assembly language programming.

INSTANT ASSEMBLER is absolutely unique among tape based assemblers in that it produces relocatable code modules that can be linked with the separate LINKING LOADER, which is supplied in two versions for loading programs into either high or low RAM. This lets you build long programs with small modules. INSTANT ASSEMBLER also features immediate detection of errors as the source code is entered, a compactly coded source format that uses 1/3 as much memory as standard source, and many operational features including single stroke entry of DEFB and DEFW, pinpoint control of listings, alphabetic listing of symbol table, separate commands for listing error lines or the symbol table, block move function, and verification of source tapes.

INSTANT ASSEMBLER's debugger provides single stepping with full register displays, decimal or hex entry of addresses, forward or backward memory displays, disassembly of object code in memory, memory display in ASCII format, and hex-to-decimal or decimal-to-hex conversion. The single-stepper will step one instruction at a time or at a fast rate to any defined address.

INSTANT ASSEMBLER occupies less than 8400 bytes of memory. In a 16K machine this will leave you enough memory to write assembly language programs of around 2000 bytes. This and its module-linking feature make INSTANT ASSEMBLER ideal for users with only 16K machines. The instruction manual may be purchased separately for \$3, which will apply towards the purchase of the INSTANT ASSEMBLER. In addition to disk I/O, the disk version includes a stand-alone version of the debugger.

Specify Model I or Model III. TAPE INTASM.....\$29.95

RESTORE DAMAGED TAPES WITH RESQ2

Cassette recordings are subject to several types of damage. Thin spots in the oxide, dirt, voltage fluctuations while recording, or stray magnetic fields can all contribute to lost or added bits. RESQ2 was written to provide a method of restoring tapes that can no longer be loaded for these reasons. It can restore BASIC, SYSTEM, ASSEMBLER, and DATA tapes. RESQ2 compares two copies of the damaged tape to attempt a restoration, though restoration can often be accomplished with only one copy. After the damaged data is corrected in memory, a new tape may be recorded and verified which does not contain the errors. The success rate of RESQ2 will depend on the severity and quantity of errors. RESQ2 comes with a comprehensive user manual and examples of two types of "crashed" programs to practice on.

Specify Model I or Model III. RESQ2.....\$19.95

SINGLE STEP THROUGH RAM OR ROM

STEP80 allows you to step through any machine language program one instruction at a time, and see the address, hexadecimal value, Zilog mnemonic, register contents, and step count for each instruction. The top 14 lines of the video screen are left unaltered so that the "target program" may perform its display functions unobstructed. STEP80 will follow program flow right into the ROMs, and is an invaluable aid in learning how the ROM routines function. Commands include step (trace), disassemble, run in step mode at variable step rate, display or alter memory or CPU registers, jump to memory location, execute a CALL, set breakpoints in RAM or ROM, write SYSTEM tapes, and relocate to any page in RAM. The display may also be routed to your line printer through the device control block so custom print drivers are automatically supported.

Specify Model I or Model III. STEP80.....\$16.95

RAM SPOOLER AND PRINT FORMATTER

This program is a full feature print formatting package featuring user definable line and page length (with line feeds inserted between words or after punctuation), screen dump, printer pause control, and baud rate selection. In addition, printing is done from a 4K expandable buffer area so that the LPRINT or LLIST command returns control to the user while printing is being done. Works with cassette or disk systems. Ideal for Selectric or other slow printers. Allows printing and processing to run concurrently. Output may be directed to either the parallel port, serial port, or the video screen. 80 Microcomputing said "I can only give my highest recommendation of Spooler and Mumford Micro Systems."

Specify Model I or Model III. SPOOLER.....\$16.95

DUPLICATE SYSTEM TAPES WITH CLONE

Make duplicate copies of almost any tape including Basic, SYSTEM, data lists, assembler source, or "custom loaders". The file name, load address, entry point, and every byte (in ASCII format) are displayed on the video screen. Model III version allows changing tape speed so you can load in a tape at 500 baud and write it out at 1500.

Specify Model I or Model III. CLONE.....\$16.95

ORDERING: Complete satisfaction is guaranteed or a full refund will be made. All programs (except TEL.COM) are shipped on cassette unless \$5 is included for a formatted (no system) disk. Include \$1.50 for postage and handling. California residents add 6% sales tax. Visa, Mastercharge and COD orders accepted. SPECIFY MODEL I OR MODEL III. Dealer inquiries invited.

TRS-80 Model I work-alike

An evaluation of the LNW-80 microcomputer

Frank Fischer and Eric Hilberg, Everett, WA

The Model T car and the TRS-80 Model I computer share one important concept. They were both developed as a simple, straightforward design with a minimum amount of frills and priced to appeal to the lower end of the market. Both enjoyed tremendous sales, but as the newness gave way under everyday use, limitations placed by the simple design began to make themselves apparent.

In the case of the TRS-80, these limitations showed themselves in slow processor speed, poor video resolution and no color capability. Other computers, with all of these features plus a higher price, soon appeared on the market. With sizeable investments in software and peripheral devices, many owners were reluctant to start all over again.

A middle-of-the-road solution in the form of the LNW-80 computer has now been on the market for over a year. Designed by LNW Research, of Costa Mesa, California (the same people who brought out the excellent expansion interface for use with the TRS-80 Model I), the computer might be considered the equal of a

second generation TRS-80 Model I. Using a Z80-A processor capable of running at either 1.77 Mhz or 4 Mhz, it has all TRS-80 Model capabilities, plus high resolution black and white graphics (480 x 192), composite video color (128 x 192), Red-Green-Blue color (384 x 192), reverse video and upper-lower character set.

The LNW-80 computer can be obtained in various forms, from the bare circuit board and manual for \$89.95, to the completed unit for \$1450. The computer is designed in such a manner that the keyboard, Level 2 read-only-memory set and monitor from a TRS-80 Model I can be used. If you don't have these items, you can order them from LNW, as well as selected integrated circuits, power transformer and the case.

While the parts packing density is high, over 100 integrated circuit chips as well as on-board filtering and power regulation (all on a 10 x 16 inch circuit board), the layout appears to follow good engineering principles. The quality of the printed circuit traces as well as the solder mask and thru-hole plating is

excellent. Mounting holes, edge connector and extra power supply capacity are provided to facilitate the addition of the expansion interface board with a minimum amount of fuss.

Assembly of the computer board is straightforward. Sockets for the integrated circuits (recommended by LNW as the traces and pads are small and therefore subject to damage by repeated soldering) are usually installed first, followed by the resistors, capacitors and other remaining parts. When all of the soldering is done, the rosin residue should be cleaned off and all solder joints given a careful examination. This is also a good time to verify the polarity of the diodes and capacitors.

Checking out the board begins with the power supply. Once this section is working properly, the jumpers, to bring power to the main part of the board, can be installed as well as the integrated circuits needed for the portion to be tested. The firmware used can be the Radio Shack Level II, two or three read-only-memory set, or the LNW six

read-only-memory set with P1 optioned to match the particular set used. With keyboard and monitor hooked up, application of power should show "MEMORY SIZE?" on the screen — if Mr. Murphy has not hexed you.

With the experience of five units to draw upon, performance has been the following: One unit powered up with no problems, three had problems in the area of wrong parts installed, faulty parts or bent integrated circuit pins, and one unit had a problem that required a call to LNW (they give excellent technical support). Black and white low resolution is standard TRS-80; the high resolution is very sharp. The composite video color, using a direct link to the monitor, works well but the radio frequency modulator, the color picture is rather marginal. The colors are not sharp and have "snow" in the background. One user installed an external radio frequency modulator which gave a little better picture. No one we know of has attempted to use the high resolution Red-Green-Blue color yet.

Although the documentation provided by LNW is brief, it is adequate. It can be augmented by the TRS-80 Level II technical manuals. While the schematics in the technical manual are different, the description of the logical operation of the various circuits is helpful.

The methods used (influenced in part by the skill and financial resources of the builder) in the construction of the computers were varied. In one case, a defunct 980 Adds terminal was cannibalized for its case, keyboard, monitor and power supply. Two persons chose to build their own cases. Small part procurement ranged from junk box to Digi-Key and JameCo. One unit was built from parts supplied almost entirely by LNW.

Building the LNW-80 computer has been a rewarding project, financially as well as emotionally. For a few hundred dollars, we have a system that is competitive with commercially-built systems costing over 2 thousand dollars. The pride associated with the statement, "I built it myself", does wonderful things for one's ego. ■

Add disk and memory to Model III

Do it yourself and save \$\$\$

Model III

Sal Navarro, East Rutherford, NJ

This article will tell you how to save approximately \$600 when upgrading your Model III 16K computer to a 48K Model III with two disk drives. The task is accomplished in one hour with the use of an excellent set of instructions, a phillips screwdriver, a standard screwdriver and a pair of cutters.

After checking out the specifications of the different upgrade kits on the market, I chose the one advertised by B. T. Enterprises. This kit comes with a switching power supply manufactured by the same company that supplies the one in the Model III from Radio Shack. The only difference in this power supply is that it has a dual (120 volt/220 volt) voltage transformer on board. The quality of the disk controller board is equal to, or better than, that of Radio Shack's. The drive supports are made of high quality metal and the drives I purchased are Tandon. The memory chips are NEC, with 150 nanosecond switching time.

The kit arrives

I ordered my 48K memory kit and disk controller with two drives from B. T. Enterprises, 171 Hawkins Road, Centereach, New York 11720 (516) 588-5836, for \$849.95. By comparison, Radio Shack's kit was \$1446.00 plus installation. The kit and instructions arrived in first class condition.

Upon reading the instructions, I found that they were geared to the

novice. Anyone could install these parts with no problem that I could perceive. The disk controller comes from Micro Mainframes.

One thing I noted was that the edge connectors are gold plated. Anyone having previously owned a Model I will testify to having to "Pink Pearl" (use an eraser) a lot because of connections not being gold plated. Needless to say, I was impressed with what I saw, and was anxious to get everything installed.

Installing 48K of memory

If you have 48K already, you can skip this section. If not, let's put in some memory.

The first thing you must do is to remove the AC power cord, then pick out a hard, flat surface to work on. I choose my desk because it is in a room without a carpet. Remember Murphy's Law about static charges and integrated circuits. Make sure your machine has been thoroughly checked out.

Now, lay down something soft on the work area as not to scratch the computer. Place the computer on the cloth, laying on its back. You will see nine screw holes. Remove the screws and remember which length screw came from where.

Now for the Forth Worth shudder: On the lower left corner is a label which, when broken, will void your 90-day warranty. Rub your finger over the label and feel for another screw hole. Push the screwdriver through and remove screw number

10. Turn the computer right side up and remove the screw in the top center area.

You are ready to remove the top cover and video tube. Remember when lifting the cover, that the end of the video tube comes very close to the rear circuit board. If you try to force anything, it will probably be damaged. Grab the cover and lift up and toward the left so that you can see under the case if anything starts to grab. Do not pull or tug because there will be two cables connected inside the cover after it is lifted off of the machine.

Lay the cover down on the left side and remove the two video connectors. Place the cover, with the video tube, where it cannot be damaged. Turn the unit around so that you are facing the rear of it. Remove the two screws on top of either side of the circuit cage. At the bottom, peel back the tape holding the foil to the bottom of the cage. Lift upward and outward on the top of the cage. Do the same on the sides, then lift off the cage cover. You can see now what you paid all of that money for.

In the top right corner of the circuit board, you will see three rows of chip sockets. The top row should be full with the original 16K you purchased. The second and third rows of sockets are where you will place the next 16K or 32K that you are going to install. If you have any doubts about Murphy and the static charge, ground yourself so as to

MODEL III DISK UPGRADE !!

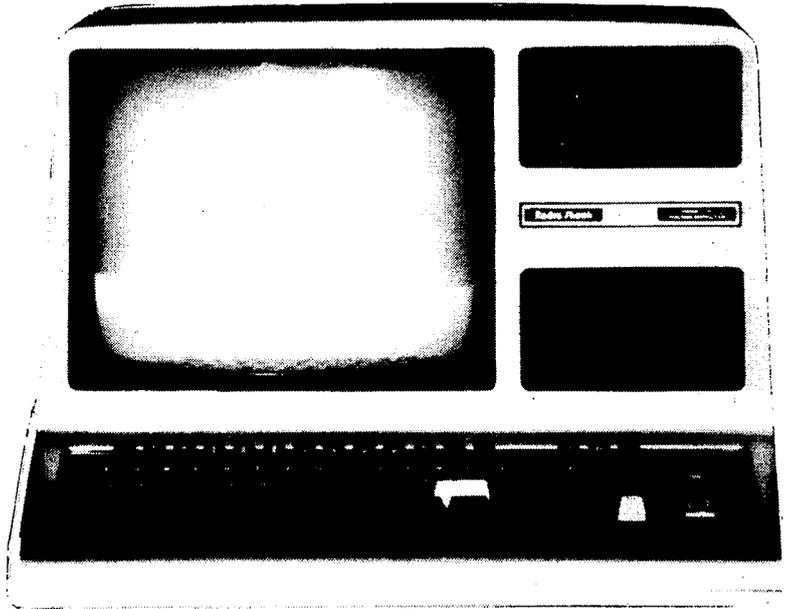

FEATURES:

- Switching Power Supply (Runs cooler)
- 40/80 Track supported
- Single/Dual Head supported
- Metal disk drive brackets
- All hardware and cables for 2 disk drive
- 1 Hour or less for installation.

Kit alone \$279.95
 Kit with 2/Tandon 100-1 40 track disk drives
 (Same as R/S) and 32K 150ns (FAST) RAM
 Memory \$849.95

DosPlus 3.4 III Operation System \$99.95
 NewDos/80 Ver 2.0 III Oper Sys . \$99.95

** Regularly 149.95 - This price with Kit
 purchase only. 1 per order!!

Put disk drive into your TRS-80 Model III. Easy to install and lower in cost than other kits.
 Compare our features with others and the choice is clear.

DISKETTES

Elephant Memories Systems Diskettes at a special LOW price !!!

Single Density/Single Sided /Soft Sector	500351	\$22.50
Double Density/Single Sided/Soft Sector	500352	\$26.50
Double Density/Double Sided/Soft Sector	500353	\$32.50

PORTABLE DISK BULK ERASER

Clean all old data off of your diskettes before reusing them! This is a MUST for your computer room. Easy to use. non-electric, portable!!!
 500102 Only ... \$4.95

Circle # 10

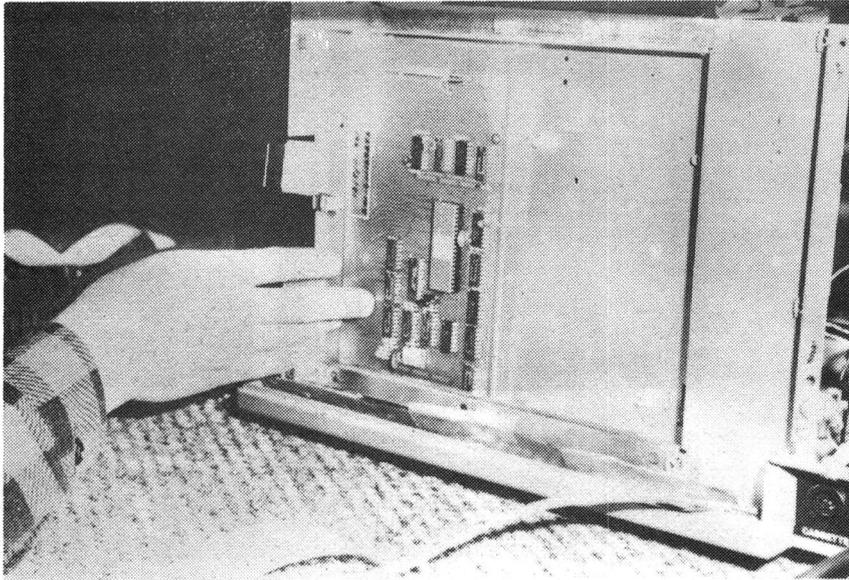

Photo 1. The disk controller being put into place. Photographs in this article are by the author.

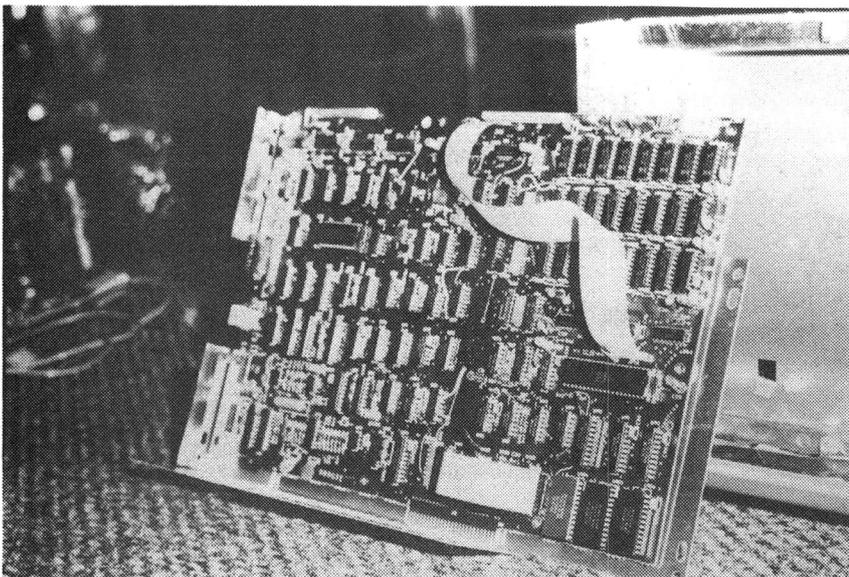

Photo 2. Main board removed and with 48K of RAM installed.

dissipate any charge you may have built up.

Be sure to insert the chips correctly. The notch is pointed up as the chip is installed in the socket. If you are only adding 16K at this time, make sure that they all go into the second row. If you already have 32K and are expanding to 48K, the chips will go into the third row.

Reverse the disassembly procedure, being sure to reinstall the two video connector cables to put the machine back together. After you are through with the reassembly, turn on the machine and press the ENTER key twice to get past CASS? and MEM SIZE. Now type "PRINT MEM". For a 32K machine, it should answer 31698 and a 48K machine should answer with 48082.

Now put back all the screws in the bottom and the one in the back. If you are going to install the disk modification now, you should have stopped after installing the chips.

Installing the disk kit

Remove the main board and place it where it will not be damaged. Mount the disk controller board on the left side of the chassis on the metal standoffs using the 6/32 screws provided with the kit. Take the four-inch long ribbon cable and insert it into the connector at the top of the board. Replace the main board, taking care not to drop any of the rear insulators. Put back all the cables you removed before. You can double check yourself with the diagrams in the instruction sheets.

Turn your computer around and install the drive mount brackets in their noted positions using the supplied hardware and screws. Before I installed my drives, I installed the power supply connectors into the drives. This is a lot easier with the drives in front of you.

Place drive zero in the lowest position and secure it to the brackets. Install drive one in the upper position and secure it. Take the power supply and peel off the covering on the double-sided tape and secure it to the floor of the cabinet. Take the power supply cables from both drives and connect them to the power supply on positions SK2 and SK3. Locate the small white connector in the Tandy

cable harness and connect it to SK1 on the power supply board. Connect the free end of the 20-pin ribbon cable on the disk controller board to J7 (small white connector on the top left) of the main computer board. Make extra sure that both ends are tightly secured.

Connect the remaining 10-inch long flat ribbon cable from the small black connector just above the Z-80 to the one just like it below the white connector in the center of the board. Connect the drive cable to the drives with the red stripe of the cable to the left side of the drives. Double-check all of your connections, making sure that you haven't missed anything. Be certain, or Murphy will let you know.

Almost finished

Now you have to remove the plastic disk drive dummy doors from the video cabinet. Take a pair of cutting pliers and snip the edges around the inner ring of the inserts. Be careful not to rush and take large cuts. Just snip each of the joints and it will fall out.

Now you have drives

Place the cover next to the computer base and reconnect the video plugs. Gently and carefully place the cover back on the computer, being careful with the rear of the tube. Power up the computer and it will respond with "Diskette?". Now take your operating system and insert it into the bottom drive and press the RESET button. It should sign on and be ready to run. If not, recheck all of the steps you have done.

There is a "When things go wrong" list included with the instruction sheets which lists most of the problems that have occurred in the past. The only problem that I ran into was that the power supply cable to drive zero had a loose wire in it. Beyond that, it went together in under one hour.

The instructions are simple to follow and easy to read. I have used this system for two months now, and it has not missed a bit. If you are planning to upgrade your system to disks, I highly recommend the Micro Mainframes disk controller and power supply from B. T. Enterprises ■

Solving simultaneous linear equations

Matrix manipulation

Model I, II and III

J. C. Adams, Jr., Ph.D., Tullahoma, TN

The solution of sets of simultaneous linear algebraic equations consumes a significant fraction of the computer time at virtually all general purpose computer service centers. The solution of such sets arises in a wide variety of problems, including the numerical solution of ordinary and partial differential equations, structural analysis, network analysis, optimization, data analysis, and curve fitting. Sets composed of large numbers of equations are commonly encountered, and the choice of a suitable technique for a given problem which is both accurate and efficient is of prime concern. This article will present one such method applicable for solution of sets of simultaneous linear algebraic equations using the Radio Shack TRS-80 Model I microcomputer system with Level II BASIC.

BASIC Matrix Terminology

A matrix is defined in this context as a rectangular array of numbers, with its size characterized by the number of rows and columns in the array. Thus:

$$A = \begin{bmatrix} 1 & 7 & -1 & 4 & 8 & 7 & 3 & 1 \\ 2 & -4 & 7 & 0 & 1 & 9 & 9 & 6 \\ 1 & -1 & 0 & 5 & 3 & 7 & 2 & -1 \\ 4 & 4 & 9 & 8 & -2 & -8 & 3 & 0 \\ 3 & 6 & 2 & -7 & 5 & 8 & 0 & 5 \end{bmatrix}$$

Dr. Adams is Director of the Computer Service Center for Sverdrup Technology, Inc., an advanced technology company which offers engineering and consulting services. He has over 15 years of experience in performance and management of large-scale digital computer simulations involving scientific/engineering phenomena, including computational fluid dynamic studies using the CRAY-1 supercomputer.

is a five (row) by eight (column) matrix. Any given element of the matrix A will be denoted by A(I,J), where I is the row location and J is the column location. Thus, A(3,4) = 5. Our concern for this article will be with square matrices (number of rows = number of columns) and column vectors of the form:

$$B = \begin{bmatrix} 4 \\ -2 \\ 5 \\ 9 \\ 1 \end{bmatrix}$$

which is denoted as B(J), where J is the column location. Thus, B(3) = 5.

Consider a set of simultaneous linear algebraic equations (we arbitrarily choose three equations in three unknowns for illustrative purposes). This set can be written as:

$$\begin{aligned} A(1,1) X(1) + A(1,2) X(2) + A(1,3) X(3) &= B(1) \\ A(2,1) X(1) + A(2,2) X(2) + A(2,3) X(3) &= B(2) \\ A(3,1) X(1) + A(3,2) X(2) + A(3,3) X(3) &= B(3) \end{aligned}$$

An equivalent representation in matrix form is:

$$\begin{bmatrix} A(1,1) & A(1,2) & A(1,3) \\ A(2,1) & A(2,2) & A(2,3) \\ A(3,1) & A(3,2) & A(3,3) \end{bmatrix} \begin{bmatrix} X(1) \\ X(2) \\ X(3) \end{bmatrix} = \begin{bmatrix} B(1) \\ B(2) \\ B(3) \end{bmatrix}$$

or, $A X = B$, where A is the square matrix of coefficients, X is the column vector of unknowns, and B is the column

Feature math program

vector of the right hand sides. A numerical example in matrix format is as follows:

$$\begin{bmatrix} 3 & 1 & -1 \\ 1 & 4 & 1 \\ 2 & 1 & 2 \end{bmatrix} \begin{bmatrix} X(1) \\ X(2) \\ X(3) \end{bmatrix} = \begin{bmatrix} 2 \\ 12 \\ 10 \end{bmatrix}$$

which has the exact solution:

$$X = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

or $X(1) = 1$, $X(2) = 2$, and $X(3) = 3$.

Numerical Solution Algorithm

One of the most commonly employed direct methods for the numerical solution of sets of simultaneous linear algebraic equations is the so-called Gaussian elimination described in complete detail by most numerical analysis textbooks (see Bibliography). One computational difficulty can arise with the standard Gaussian elimination technique. The pivot element in each row is the element on the main diagonal of the matrix. Under certain circumstances, the diagonal element can become very small in magnitude compared to the rest of the elements in the pivot row, as well as perhaps being quite inaccurate. For various reasons, this can create a very unfavorable situation in terms of roundoff error which can result in an inaccurate solution vector.

This type of roundoff error problem can be particularly significant with large sets of equations. The problem can be effectively treated by interchanging rows in the matrix (and in the right hand side) to bring the largest element in the column to the pivot position. Strategies to maximize pivot elements are sometimes called "positioning for size" or "pivoting."

Almost all large-scale modern computing installations performing scientific/engineering calculations have "stock" subroutines for solving sets of simultaneous linear algebraic equations. These are usually based on variants of Gaussian elimination, employing pivoting.

One of the most readily available, best documented, efficient, and of proven accuracy, "stock" subroutines, is contained in the IBM Scientific Subroutine Package (see Bibliography). This subroutine, called SIMQ, is written in FORTRAN for use on IBM System 360 computers. A Level II BASIC version of subroutine SIMQ is presented in the associated listing.

Complete documentation of this subroutine is provided via comments by REM statements. Also provided is a cross reference listing of all subroutine variables, BASIC statements, and BASIC functions by line number. It is important to note that the coefficients of matrix A must be stored columnwise in vector format for use in subroutine SIMQ.

Application of Subroutine SIMQ

In order to apply subroutine SIMQ for numerical solution of sets of simultaneous linear algebraic equations of the form $AX=B$, a controlling or executive

program must be written to input the A-matrix and the B-vector as well as to output the X-solution vector. Provisions must be included to report the possibility of a singular matrix (if matrix A is singular, no unique solution exists) as determined by subroutine SIMQ via the KS (output digit) variable.

One fairly general controlling, or executive, program, is given in the listing, again written in Level II BASIC. Note that all variables beginning with an I through N are declared to be integer variables (the DEFINT I-N statement). All variables beginning with an A through H or O through Z are declared to be double precision variables (the DEFDBL A-H, O-Z statement).

As discussed in the last section, the primary difficulty in the numerical solution technique is roundoff error. The best defense for this is a large word size (many decimal digits), hence double precision arithmetic. Further note that the A-matrix and B-vector coefficients are input as string variables and converted to double precision numerical quantities through the VAL function; this is per the discussion on page 4/22 of the Second Edition of the Level II BASIC Reference Manual.

The A-matrix is stored columnwise in vector format as required for use in subroutine SIMQ. Dimensions for both the A-matrix and B-vector are set in line 50 based upon the input value N for the number of equations to be solved. The solution vector X is returned as the B-vector from subroutine SIMQ. If matrix A is singular, subroutine SIMQ returns a value of KS equal to unity (1), which is acknowledged at line 160 and accompanied by a STOP statement.

Some illustrative problems for solution using subroutine SIMQ follow. The reader is urged to work these problems using his/her version of subroutine SIMQ in order to ascertain that the subroutine has been correctly typed from the article listing. Needless to say, all comments denoted by REM statements in subroutine SIMQ (with the exception of line 10000) could be deleted if additional free memory needed to be made available. All blank spaces in subroutine SIMQ should also be eliminated in a production version where speed of execution is a primary factor.

Example Problem 1

Solve:

$$1.01 X(1) + 0.99 X(2) = 2$$

$$0.99 X(1) + 1.01 X(2) = -2$$

which has the exact solution $X(1) = 100.0$ and $X(2) = -100.0$ with the SIMQ-computed input/output shown in the example problem listing.

Example Problem 2

Solve:

$$0.24 X(1) + 0.36 X(2) + 0.12 X(3) = 0.84$$

$$0.12 X(1) + 0.16 X(2) + 0.24 X(3) = 0.52$$

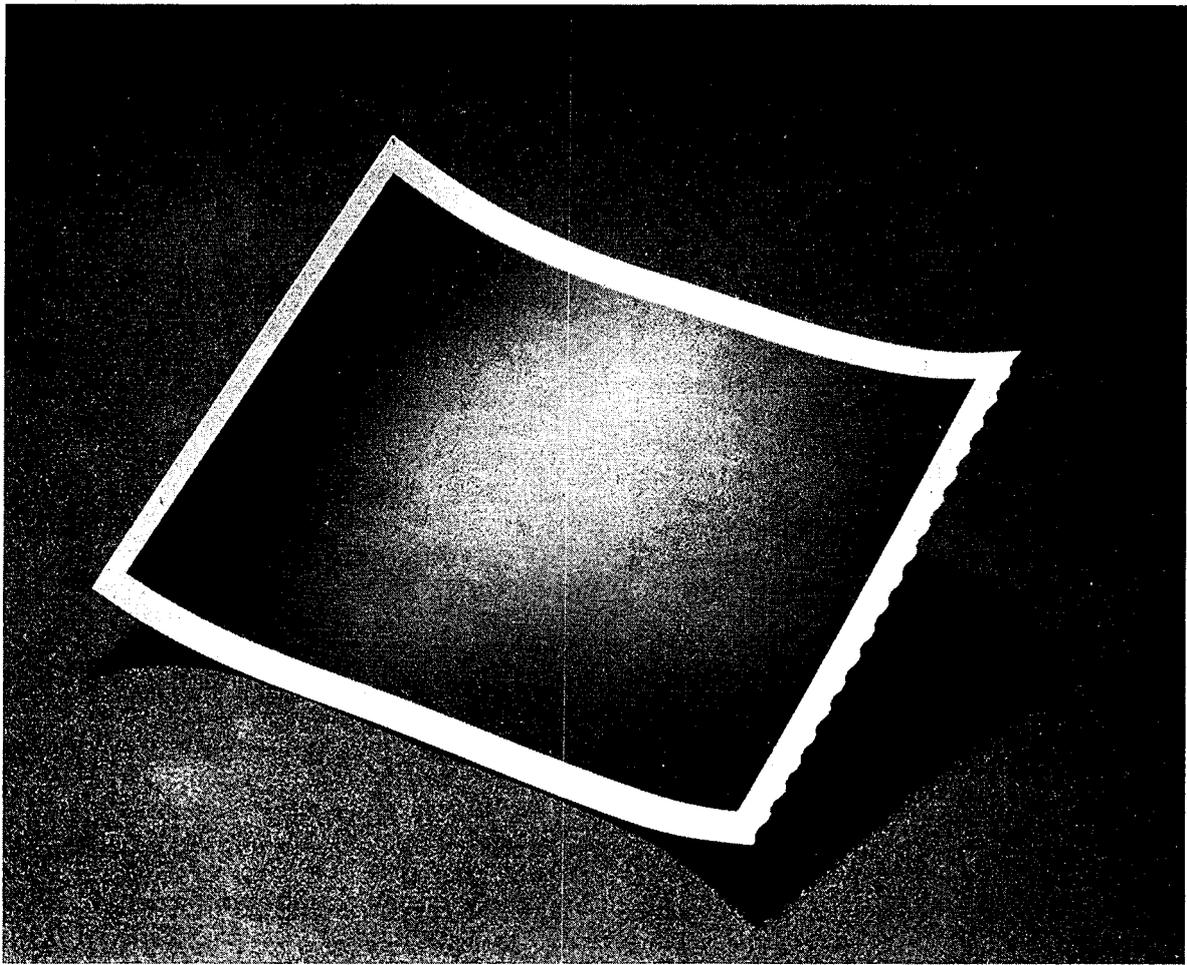

$$0.15 X(1) + 0.21 X(2) + 0.25 X(3) = 0.64$$

which has the exact solution $X(1) = -3.0$, $X(2) = 4.0$, and $X(3) = 1.0$ with the SIMQ-computed solution:

$$X(1) = -3.000000000000001$$

$$X(2) = 4.000000000000006$$

$$X(3) = 1.000000000000001$$

This is a picture
of all the printers in the world
that outsell the MX-80.

Epson.

The one thing you can't beat in the marketplace is value. And there simply isn't a better combination of reliability, print quality, features and price in an 80-column printer than the Epson MX-80. Anywhere on earth.

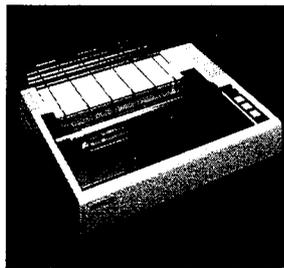

But while we're pleased to make the best-selling 80-column printer in the world, we're hardly surprised. Because we decided a long time ago that the way to succeed in this business is to build a good product, sell it at a fair price, and stand behind it.

So we built our MX-80 with features like a choice of 24 different type faces, graphics that rival plotters, logical seeking, bidirectional printing and the world's first disposable print head. We priced it at under \$650. And if it breaks, we'll be here to fix it.

That seems like a straightforward enough policy. But when we first introduced the MX-80, the competition

laughed. Now they're cutting prices, introducing "new" models, and running splashy color ads, all in an effort to catch up. And they're not laughing.

But you don't have to take our word for it. You've got a choice: you can buy the printer that's been embraced by several hundred thousand computer fanatics all over the world. Or you can buy something else. And take your chances.

EPSON
EPSON AMERICA, INC.

Circle # 12

May, 1982 37

Example Problem 3

Solve:

$$\begin{aligned} 4 X(1) + 3 X(2) - 1 X(3) &= 6 \\ 7 X(1) - 2 X(2) + 3 X(3) &= 9 \\ 5 X(1) - 18 X(2) + 13 X(3) &= 3 \end{aligned}$$

which has no unique solution, i.e., the A-matrix is singular. The present problem was contrived by forming the third equation as a linear combination of the first two equations. In practice, it is quite common in certain physical problems to accidentally form a singular set of equations by applying a physical principle which is not independent of the other physical principles used to construct the set. This singular character of the set can sometimes be difficult to detect, particularly if the results of the solution happen to be physically reasonable. Remember Murphy's Law!

Computer Program Books for Beginners

Everything you need to know to get started programming your own computer. These handy books of programs, each jam-packed with easy-to-understand info for beginners, are crammed with hundreds of tips, tricks, secrets, hints, shortcuts, techniques, plus hundreds of tested ready-to-run programs. For the TRS-80 Color Computer. For the TRS-80 Pocket Computer and Sharp PC-1211, PC-1500, Casio FX-702P pocket computers, as well as for Apple and IBM.

Color Computer

101 Color Computer Programming Tips & Tricks, learn-by-doing instructions, hints, secrets, shortcuts, techniques, insights, for TRS-80 Color Computer, 128 pages **\$7.95**
55 Color Computer Programs for Home, School & Office, practical ready-to-run software with colorful graphics for TRS-80 Color Computer, 128 pages. **\$9.95**
55 MORE Color Computer Programs for Home, School & Office, sourcebook of useful type-in-and-run software with exciting graphics, for TRS-80 Color Computer, 112 pages. **\$9.95**
The Color Computer Songbook, 40 favorite pop, classical, folk & seasonal songs arranged for TRS-80 Color Computer; ready-to-run music programs, 96 pages. **\$7.95**
My Buttons Are Blue and Other Love Poems from the Digital Heart of An Electronic Computer, for poetry lovers, computer lovers, a high-tech classic, 66 heartwarming poems written by a TRS-80 Color Computer, 96 pages. **\$4.95**
Color Computer Coding Form, handy preprinted programming worksheets make writing software easy, fun, 40-sheet pad. **\$2.95**

Pocket Computer

101 Pocket Computer Programming Tips & Tricks, secrets, hints, shortcuts, techniques from a master programmer, 128 pages. **\$7.95**
50 Programs in BASIC for Home, School & Office, sourcebook of tested ready-to-type-in-and-run software for TRS-80 and Sharp pocket computers, 96 pages. **\$9.95**
50 MORE Programs in BASIC for Home, School & Office, ideal source for lots more useful software for TRS-80 and Sharp pocket computers, 96 pages. **\$9.95**
Murder in The Mansion and Other Computer Adventures, with 24 game programs: murder mystery, space, adventure, loads of fun for TRS-80 and Sharp pocket computers, 96 pages. **\$6.95**
Pocket Computer Programming Made Easy, new fast 'n easy way to learn BASIC, make your computer work for you, for TRS-80, Sharp, Casio pocket computers, 128 pages. **\$8.95**
35 Practical Programs for the Casio Pocket Computer, book of useful type-in-and-run software for the FX-702P, 96 pages. **\$8.95**
Pocket-BASIC Coding Form, preprinted program worksheets make writing programs a breeze; for TRS-80, Sharp, Casio pocket computers, 40-sheet pad. **\$2.95**
Universal BASIC Coding Form, programming worksheets for anybody writing in BASIC for any computer system, make writing program lines easy and fun. 40-sheet pad. **\$2.95**

YOUR Family Tree

By Chuck Acree

NEW!

A comprehensive genealogical program that lets you avoid the rigidities of paper-based family trees. It quickly and easily sets up a data base to hold pertinent information about each ancestor, including name, date and place of birth, marriage and death information, plus a comment line.

YOUR FAMILY TREE will display and print a complete "pedigree" for any selected family member; or a 3-generation ancestral chart may be generated for display or printer, showing the number of known ancestors beyond each branch of the tree. As a novelty feature, the program will display a U.S. outline map showing migration across the country. Access to information in YOUR FAMILY TREE is virtually unlimited, with full search capabilities on any key field—using full or partial information.

16K RAM has space for 45-55 ancestors with brief comments. A 32K cassette-based system will hold about 175 records; a 48K, about 300. In all cases, a disk-based system will hold about 75 less due to DOS overhead.

Available for TRS-80* models I and III on tape or disk, YOUR FAMILY TREE requires a minimum of 16K RAM. Enjoy the benefits of this powerful and flexible charting system now for just \$29.95.

ACORN PROGRAMS ARE AVAILABLE AT FINE COMPUTER STORES EVERYWHERE

MONEY MANAGER

By Andrew P. Bartorillo

A complete management tool for the home budget, it accurately keeps track of your checkbook and provides an easy method of budget allocation.

You can store information on up to 100 checkbook entries per month (250 with 48K), specify any automatic withdrawals, keep records of tax-deductibles, and record expenses by category. You can even break up charge account payments into the proper categories.

Requires TRS-80* model I or III with a minimum of 32K and one disk drive. Order now for only \$39.95.

LOST COLONY

By David Feitelberg

It's the world's first deep space colony and you are the economic manager. A remarkable simulation, LOST COLONY arms you with maps and charts as tools for resource management. You assign human and robotic labor, explore new land, and set production quotas. At the same time you must determine equitable pay scales and taxes.

Communicate through your Model I or III using full sentences or short commands. A challenging game, it might give you insight into real life management as well. Available on 16K tape or 32K disk for only \$19.95 each.

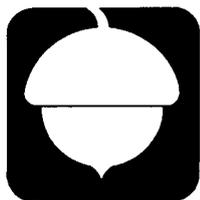

SPACE ROCKS

By Steven Kearns

Huge antimatter rocks appear on the Tactical Display Screen of your spacecraft. You blast away but they just explode into smaller chunks for you to destroy. To add to your woes, alien ships and time bombs appear periodically. If the ships hit you or the timers reach zero—BOOM! Maneuver, fire lasers, jump to hyperspace—anything to avoid the onslaught. For one or two players, with nine skill levels.

A realtime arcade game with sound, for TRS-80* model I or III. Versions for 16K tape or 32K disk are \$19.95 each.

Small business invoice program

Generates an invoice and label

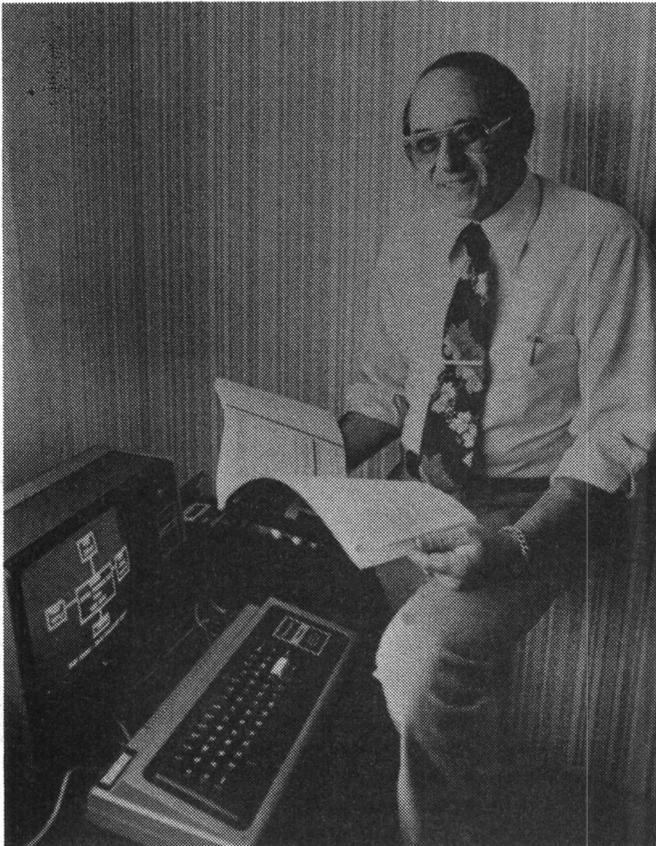

Model I/III and Color Computer with 16K extended BASIC

Fred Blechman, Canoga Park, CA

If you operate a business, you use an invoice of some sort. You may call it an order form, purchase order, bill, sales receipt, sales ticket, job order or something else. If you regularly sell ten different items or less, this

program will print and total your invoice, showing each purchase as well as special items and remarks. It will indicate the amount of any overpayment or amount due and will also print out address labels.

The author, Fred Blechman.

The Need Arises

When I started a small mail order business selling software for the Radio Shack TRS-80 a few years ago, I used a small, two-part carbon sales book—the kind you get for about 30 cents at a five-and-dime or stationary store. It looked Mickey Mouse and was! As the business grew and I offered more items for sale, the invoice got more complicated.

When business income made a custom invoice affordable, I had a local print shop run invoice forms with my company name, address and phone number. I still wrote out each invoice and shipping label until one day it dawned on me . . . Here I was selling computer programs and not using the computer for a job it could easily do. So, I wrote the Small Business Invoice Program.

Not for Everyone

If you're conversant in BASIC, you can see from the program listing how simple and unsophisticated it is. For that reason, it has some practical limitations. Of course, you must have a printer, since the purpose of the program is to generate an invoice and address labels. However, if you sell more than ten different items, this program won't do the job without several changes beyond the scope of this article.

As written, the program is intended for use with carbon paper or NCR forms since it prints out in *real time* and the information is *not* stored for additional copies or historical records. These compromises in capability greatly simplify the program but will not satisfy all needs, even though they satisfy mine.

My printer is an Okidata Microline 80 which handles

up to three thicknesses of paper as well as roll and pin feed paper. If your printer does not handle more than one thickness of paper, you can't use this program properly. This program is designed for a 4 1/2" wide form. If your printer does not have condensed characters, you can use an 8 1/2" wide invoice form. If your printer only has tractor or pin feed, you'll have to tape the invoice to the top of your regular paper and have it carry the invoice through the printer. Of course, you can also buy pre-printed tractor fed invoice forms—but if you're *that* big a spender, you'll probably want something more elaborate than this "plain vanilla" invoice program.

Look at the sample run and use the program as it is a few times to become familiar with the prompts, screen display and printout. The text, item descriptions and prices are, of course, the ones I use. You must customize the program for your own use.

Customizing

Enter the description and price of each item you sell on a separate DATA line, starting at line 1000. Looking at lines 1000-1030 in the listing as examples, notice that each line contains a short description followed by a comma and then the unit price. Do not enter more than ten items since the program will ignore any beyond ten. Do not omit line 1200 as it is needed when you have less than ten items.

Next, correct lines 240-330 to reflect your own DATA. Each DATA item is entered into arrays A\$(X) and P(X) by lines 210-330. The first DATA item is A\$(1), with a price of P(1) and goes to A\$(5) in line 285 since I have five items for sale. If you have more than four items, add them between lines 280 and 290. If you have more or less than five DATA items, renumber the (6) and (7) in lines 290, 300, 310, 320, 330, 420 and 430.

Change the text in lines 20-50 to provide instructions for proper alignment of your own invoice form and put your name, instead of mine, in line 810. The sales tax is calculated and printed by program line 530 as 6 percent of the total (T=.06*TT). If necessary, change this and "6% CA SALES TAX" later in line 530.

This all sounds like a lot of work. It isn't. The changes are pretty obvious once you get the hang of the program and they are easier to do than to describe. Once you customize the program to your own needs, you can make copies for everyday use without making any changes.

Using the Program

Using the program is very easy. Load the customized program into your TRS-80, type and enter RUN. Insert your invoice form in the printer and make sure it's ready to print. Now, using the keyboard, follow the screen prompts to enter the date, customer name and address. Three address lines are available. If you don't need the last one, just press ENTER. This information will print out on the invoice one line at a time as it's entered. If you start a line with a quotation mark, you can use any punctuation on that line except another quotation mark.

Once you've completed the customer information, the screen will show a menu of items that can be ordered by number. Just type and ENTER the menu number and the screen will confirm the choice and ask you the

quantity. Type and Enter the quantity. That item, with the *extended* price, will be printed on your invoice (but *not* on the screen). The computer memory keeps track of total cost.

Notice my menu item (6) is Special Order Item which can be used to type in *anything* for that line. I use this for special items not in DATA or quantity discounts. Enter the description, price each (using a minus number for discount, refund, rebate or other negative amount) and quantity.

When all items have been entered, Type and Enter the menu number for End of Order. Answer Y or N to the sales tax question. If you select N, the sales tax will be ignored by the printer.

You have the opportunity to enter a shipping and handling charge, after which a grand total is printed. The program calculates whether the payment was correct, over or under, and prints the appropriate message and amount.

If you have any remarks, such as specifying separate ships, back orders, price change or a personal message, the program will print one line at a time until you

Business program

respond with N to the remarks query. When you've finished your remarks, the program prints "Thanks for the Order!" followed by your name, then moves beyond the bottom of the invoice for easy removal from the printer.

Now you can print as many address labels as you need after removing your invoice and positioning the printer paper. The labels may be applied with rubber cement or any other adhesive. I prefer 2" clear plastic tape to protect the label as well as hold it in place.

Special Program Commands

There are three special commands in this program that require some explanation. Two of them involve the Microline 80 printer. Your printer may require a different command. In program line 70, the LPRINTCHR\$(29) sets the printer to 16.5 characters per inch instead of the normal 10. This condensed printing is necessary to get a reasonable amount of information on the 4½" wide invoice I use. In line 820, the LPRINTCHR\$(30) returns the printer to 10 characters per inch for printing address labels.

The last program line, 2000, allows you to make two complete program copies on cassette with a two-second gap between them. Just Type and Enter RUN 2000 with your recorder ready to record. This works without change for the Model I. However, for the Model III, change OUT255,4 to OUT236,2. Other than that, the

rest of the program will work with either Model I Level II or Model III BASIC.

So there it is. I've found this program saves me time, eliminates errors and confusion, makes my invoices consistent and provides a professional image for my small software business. If you wish to save program entry/debugging time, send \$6 to Blechman Enterprises, 7217 Bernadine Ave., Canoga Park, CA 91307 (213)346-7024 for a program cassette (postpaid USA and Canada; \$2 shipping foreign. CA residents add 6% sales tax) complete with an actual invoice!

This program is one of six programs in the Small Home Business Package available for \$29.95 from the author. Write him for details.

Interest calculations

*Generate comparative data
with your microcomputer*

Model I/III

Charles R. Jones, Germantown, MD

This program manipulates several variations of interest calculations in a manner that is somewhat instructional as well as useful. The first three types of interest calculations allow experimentation by allowing any of the variables to be "unknown". They are progressively more difficult and lead into the last three variations, which sound more complex but are actually just as straightforward. The six aspects of interest calculations presented (simple, compound, debt payments, savings accumulation, annuities and perpetuities) represent the most concise yet complete program that you will be likely to find anywhere.

The fourth variation uses a printer since it is a little more complex. One of my friends tried to get a savings account forecast from his bank, assuming that he deposited his retirement check every month at the new high interest rates. His check increases annually with the cost of living, but Uncle Sam has to have his cut. Needless to say, his bank could not help, and he asked me to generate some comparison data on my TRS-80.

Many of us freeze up and stumble over problems like this which are supposedly a snap. All that is needed is a quick reminder of the variables involved and a program to sort out the question that we are really asking. For example, the third variation will refine your debt payments to fit the other data that you have. If it is to provide the number of payments, it will usually give you an extra payment at a reduced rate rather than a fractional payment. Likewise, it will look for the first

quarter percent interest rate that satisfies the data since most payments are based on fractional interest rather than decimal parts.

QUALITY SOFTWARE FOR TRS-80 COLOR!

ADVENTURES!!!!

For TRS-80, and COLOR-80. These Adventures are written in BASIC, are full featured, fast action, full plotted adventures that take 30-50 hours to play. (Adventures are inter-active fantasies. It's like reading a book except that you are the main character as you give the computer commands like "Look in the Coffin" and "Light the torch.")

Adventures require 16K on COLOR-80 and TRS-80. They sell for \$14.95 each.

ESCAPE FROM MARS

(by Rodger Olsen)

This ADVENTURE takes place on the RED PLANET. You'll have to explore a Martian city and deal with possibly hostile aliens to survive this one. A good first adventure.

PYRAMID (by Rodger Olsen)

This is our most challenging ADVENTURE. It is a treasure hunt in a pyramid full of problems. Exciting and tough!

TREK ADVENTURE (by Bob Retelle)

This one takes place aboard a familiar starship. The crew has left for good reasons - but they forgot to take you, and now you are in deep trouble.

DEATH SHIP (by Rodger Olsen)

Our first and original ADVENTURE, this one takes place aboard a cruise ship - but it ain't the Love Boat.

VAMPIRE CASTLE (by Mike Bassman)

This is a contest between you and old Drac - and it's getting a little dark outside. \$14.95 each.

SPACE SHUTTLE

ONE OR TWO PLAYER HIGH RES GAME - Your mission is to dock with an orbiting space platform - but you may have to land on the planetary surface for refueling first. A real value in a high res real time game. \$6.95.

KILLERBOT - (Available in 4K) - Real time action at 20 levels of difficulty as you run, sneak, and dodge your way through a bloody field of Killer Robots. Get across or die! Joysticks or Keyboard controls. TRS-80 COLOR (ANY BASIC 4K or more.). \$9.95.

SLASHBALL (Available in 4K) - This one is best described as a thinkers arcade game. It rewards fast reflexes and clear thinking - like nothing you have ever seen before. It is one of our best family games for one or two players. \$9.95.

TIMETREK - A REAL TIME, REAL GRAPHICS STARTRECK. See your torpedoes hit and watch your instruments work in real time. No more unrealistic scrolling displays! \$14.95.

STARFIGHTER - This one man space war game pits you against spacecruisers, battlewagons, and one man fighters, you have the view from your cockpit window, a real time working instrument panel, and your wits. Another real time goody. \$9.95

BATTLEFLEET - This grown up version of Battleship is the toughest thinking game available on OSI or 80 computers. There is no luck involved as you seek out the computers hidden fleet. A topographical toughie. \$9.95

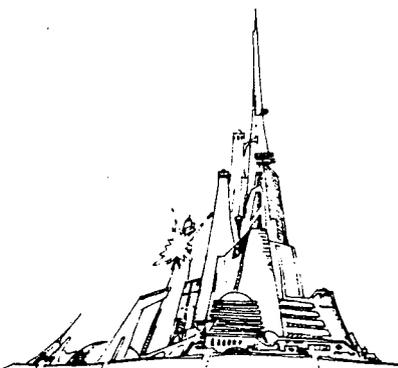

LABYRINTH - 16K EXTENDED COLOR BASIC - With amazing 3D graphics, you fight your way through a maze facing real time monsters. The graphics are real enough to cause claustrophobia. The most realistic game that I have ever seen on either system. \$14.95.

QUEST - A NEW IDEA IN ADVENTURE GAMES! Different from all the others, Quest is played on a computer generated map of Alesia. Your job is to gather men and supplies by combat, bargaining, exploration of ruins and temples and outright banditry. When your force is strong enough, you attack the Citadel of Moorlock in a life or death battle to the finish. Playable in 2 to 5 hours, this one is different every time. 16K COLOR-80 OR TRS-80 ONLY \$14.95.

SPACE ZAPPER - Protect your central Star Base from ships that attack from all four sides. Fast reflexes are required as the action speeds up. Great for kids or Dads. This game has high speed high resolution graphics and looks as if it just stepped out of the arcades. - 16K extended or 32K disk. BASIC TRS-80 Color only. \$14.95.

Please specify system on all orders

This is only a partial listing of what we have to offer. We have arcade and thinking games, utilities and business programs for the OS1 and TRS-80 Color. We add new programs every week. Send \$1.00 for our complete catalog.

THE BUG CATCHER

**This Grizzly Looking
Character Is Losing
The Bug Battle!**

TOO BAD! He continues to "WHIP" those miserable varmits the hard way . . . while the real answer is at his fingertips. He's not alone either! BUGS are an inevitable part of programming, and if you have ever tried to program in Assembly/Machine Language, you know exactly what we are talking about.

When we purchased our first TRS-80*, we were no strangers to machine language programming. We tossed out BASIC the first day, preferring to get right down to the nuts and bolts of things. What a shock! The Debugging Aids at the machine level were horrible! They were awkward to read, did not provide enough, or the right kinds of information, and required eight hands and gymnastic ability to switch from one command to another. Ridiculous!

WE DIDN'T SUFFER LONG!

Our first project was to create a truly powerful Debugging Tool. We called it *BUGOUT*, ran some advertisements, and sold a bundle of them. You know, the American dream come true. But that wasn't the end of our quest for a truly superior product. We asked every *BUGOUT* customer to give us their best ideas. Ideas that would make our product far superior to any other Debugger, and believe us, some of our customers are absolutely brilliant!

We received a truck-load of fantastic ideas, and you guessed it, we overhauled the original *BUGOUT* and created the most powerful, versatile, and easy to use Machine Language Debugger ever written for Mod I or III computers. . . BAR NONE!

HERE IT COMES

Our new Debugger is called *BUGOUT/PRO*. It is 11.5K of extremely powerful coding, and it is simply loaded with marvelous options waiting to come to the aid of beginner and expert alike. Anyone who is even remotely involved with Assembly/Machine Language programming can use *BUGOUT/PRO*. It comes with two manuals, one for beginners, with an INTERACTIVE course of instruction, and one for experts, with all the advanced features clearly spelled out.

WHAT DOES IT DO?

BUGOUT/PRO does all the things you would expect a Debugger to do, and more . . . a lot more! Beyond that, and even more important than what it does, is how it does it, how the data is displayed, and how easy it is to use!

*TRS-80 IS A TRADEMARK OF TANDY CORP

You must *EXPERIENCE* the fast, flicker-free display, the utter simplicity of operation, and the huge variety of commands to make a fair appraisal of this product. No advertisement could possibly tell it all . . . so we are saving the best features for our *RISK-FREE* home examination.

RISK-FREE EXAMINATION

That's right, you can examine *BUGOUT/PRO* in your own home or office with our 100% guarantee of satisfaction. If *BUGOUT/PRO* doesn't live up to your expectations, simply return it for a full refund. What could be more fair?

BUGOUT/PRO sells for **\$69.95** and is worth every penny we ask, and more! Just think of all the hours you've wasted searching for bugs. *BUGOUT/PRO* will make Assembly/Machine Language programming faster, easier, and far more enjoyable. Beginner or expert, *BUGOUT/PRO* is the Cadillac, Lincoln, and Rolls Royce of Debuggers rolled into one.

WILL THE BUGS WIN?

When you own *BUGOUT/PRO*, you are on the road to winning the bug battle. *BUGOUT/PRO* is supplied on TAPE or DISK, and either version automatically runs on both Mod I and Mod III computers. TAPE and DISK versions are identical, but be sure to specify which one you want. We accept Master Charge, Visa, Money Order, or Personal Checks. Foreign Orders and C.O.D.'s are \$5.00 extra. Washington state residents add 5.3% sales tax.

Take advantage of our *RISK-FREE* offer today. *BUGOUT/PRO* is a must investment for all machine language programmers.

German Language Edition available in Europe from Hanspeter Schmid, Lenastr. 2, 6906 Leimen, W. Germany.

TRS-80 OWNERS REJOICE!

Our professional quality software development tools let you program your TRS-80 with more ease and power than you ever imagined possible. Programming will become a pleasure when you use our full screen editors. These editors are not just patched up word processors. They have been specially designed to enhance the BASIC and ASSEMBLER programming languages. Our assemblers provide full screen option menus to relieve you of the burden of remembering command names. Combine user oriented features like this with the finest and most extensive documentation in the industry and you will see why programming a TRS-80 is now better than ever.

T-ZAL: TAPE BASED ASSEMBLER: Assemble to memory or tape. Create relocatable SYSTEM tapes! Includes relocating LOADER pgm. 8 character symbols with XREF. Upgrades to disk when you do!
Mod 3 Cat # 1250-20 \$ 49.95

FULL SCREEN PROGRAM TEXT EDITORS: All CAU full screen editors support four way cursor motion and scrolling with user selectable auto repeat and scroll speeds. Totally visual character insert, delete, and change. Block move, copy, delete. Global find and change. Editor for BASIC also provides automatic line renumbering and 26 user-definable macro keys.

For Tape and Disk BASIC:
Mod 1 Cat # 1010-20 \$24.95
Mod 3 Cat # 1210-20 \$29.95

For Mod 1 EDTASM source files:
Tape Cat # 1010-30 \$24.95
Disk Cat # 1010-31 \$34.95

(Disk version shipped on tape)

M-ZAL: DISK EDITOR/ASSEMBLER: Modular Assembler Language development system includes full screen text editor, multi-pass assembler, and object module linker. Allows 8 character symbols and source file chaining/nesting with *INCLUDE cmd. Full support for relocation and global symbols. Symbol table with cross reference. Req. 32K Disk system.

Mod 1 Cat # 1050-10 \$149.00
Mod 3 Cat # 1250-10 \$149.00

XBUG: DEBUGGING TOOL & MONITOR: Display/Modify memory and regs. Set up to 10 invisible and transparent breakpoints. Multi-speed single step. Load/Copy/Create SYSTEM tapes. Uses only 2.5K and can be dynamically relocated to any address.

Mod 1 Cat # 1020-10 \$19.95
Mod 3 Cat # 1220-10 \$19.95

Note: these products are not available for level 1 machines.

When ordering specify Model, RAM size, # of disks.

Send check, money order, or MC/VISA numbers and expiration date to:

*TRS-80 is a TM of Tandy Corp

Screen printing with MX-80

*Dump alphanumerics and
graphics to the printer*

Model I/III, 16K and up

Ron Goodman, North Hollywood, CA

The big computer systems are blessed with a wonderful button. It is off to the side of the keyboard, and is called the "screen print" button. Its function is to print the entire screen onto a printer so that you can have a hard copy.

The TRS-80 doesn't have such a button. Besides, many printers don't print the graphics that might be on the screen of a TRS-80. The most popular TRS-80 printer, the Epson MX-80, can print the graphics that are on the TRS-80s screen. By using the program presented here with an MX-80, you can have the advantage of a screen print button.

When Can the Program Work?

Just about any time that the BREAK key returns you to the READY mode, this program will work. If you are in the READY mode, it will work. It will work while running most BASIC programs. (Exceptions to this are BASIC programs that disable the BREAK key.) It can work during an INPUT

command, in the SYSTEM mode, or at any time during the running of a program.

Few assembly language programs will allow this program to work. Putting a CALL 16396 or CALL START (where START = the starting address of the screen print routine) in the main driver of an assembly language program, will, in many cases, enable the screen print key.

Enter the program from Editor Assembler or from TBUG, and create a system tape. The program is located directly over the disk command area. If you have disk capability, you will have to use an editor assembler and change the value in line 180 to a high address. Change it to 7FB9H for 16K, BFB9H for 32K, or FFB9H for 48K. You must also set memory size to 32696 for 16K, 49080 for 32K, or 65465 for 48K.

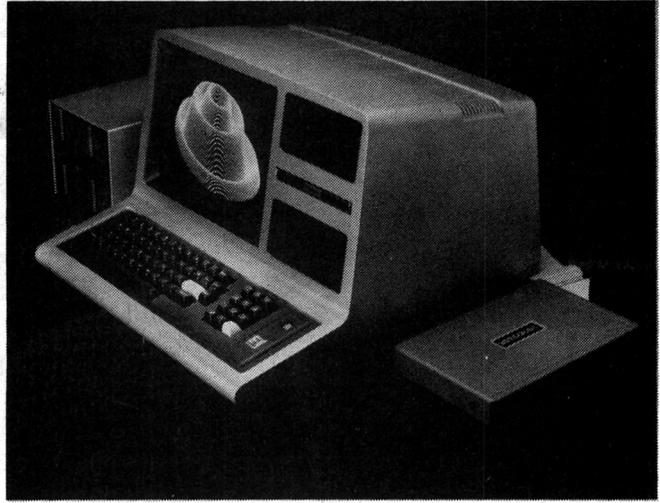

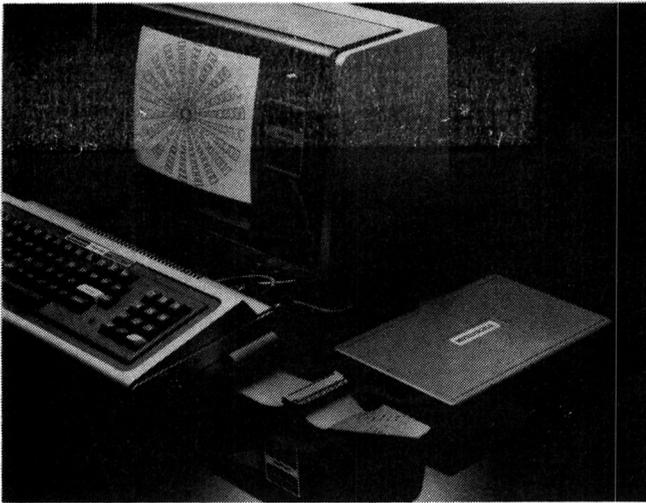

When the program is loaded, the screen print key is automatically active. Press the SHIFT key and the

BREAK key. If your printer was ready, whatever is on your screen will soon be on paper from your printer. If it wasn't ready, don't worry. The screen print program will be in a loop until your printer is ready. If, while printing, you decide to stop the printout, just press ENTER and control will be returned to BASIC.

This program should work for other printers, but unless the printer's graphics codes are like those on the EPSON MX-80, graphics won't turn out. On the MX-80, the graphics codes are different from TRS-80's codes. A code can be converted by adding 32 to the TRS-80 code. This program handles that automatically.

Notice that cassette users don't need to answer the memory size question. This is because the program resides in memory that is normally not used. In a sense, this program does not require any memory. At least, you will not miss the memory that it does use.

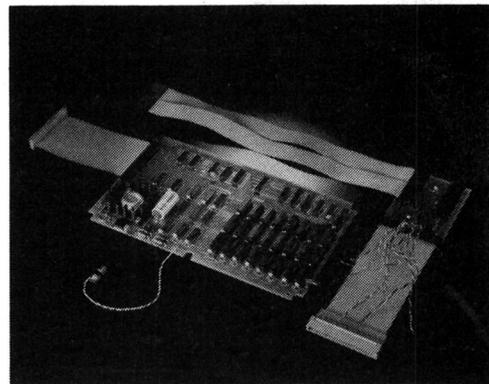

TURN YOUR COMPUTER INTO A GRAPHICS MACHINE

WITH THE MIKEEANGELO[®] GRAPHIC SYSTEM!!

[®]MIKEEANGELO is a hardware/software system designed for the TRS-80 model I & III computers. When installed, your 80 will come alive with graphic ability!!

If you've been waiting for a graphic system with the best dots/dollars ratio, take a look at our MIKEEANGELO. [®]

HARDWARE

- TOTAL SCREEN INVERSE VIDEO
- TWO MODES OF DENSITY:
384 × 192 or 191 × 192 for Model I
512 × 192 or 256 × 192 for Model III
- EVERY DOT CAN BE SET, RESET or TESTED
- 12288 BYTES OF FAST 200 ns MEMORY
- FUNCTIONS SELECTED BY OUTPUT PORT #254.
- MEMORY MAPPED FOR SPEED
- OCCUPIES LAST 16K BLOCK OF MEMORY
- CAN BE USED AS NORMAL MEMORY
(if you have 32K or more of memory)
- COLOR COORDINATED ENCLOSURE
- DOES NOT CONFLICT WITH DISK OR CASSETTE I/O
- SELF SWITCHING POWER SUPPLY
(Powers up with Computer)
- COMES WITH IT'S OWN WALL TRANSFORMER
- NOT A CHARACTER GENERATOR!!
- EASY INSTALLATION
(Requires only 18 solder connections and one trace/pin cut)

SOFTWARE

- COMES WITH SAMPLE AND DRIVER SOFTWARE
- USABLE THROUGH BASIC OR MACHINE LANGUAGE
- EXCELLENT INSTALLATION/
OPERATION MANUAL

TOOL KITS AVAILABLE FOR JUST \$15.00

MANUAL AVAILABLE SEPARATELY FOR \$15.00

The Scott Adams Adventure Series AN OVERVIEW

I stood at the bottom of a deep chasm. Cool air sliding down the sides of the crevasse hit waves of heat rising from a stream of bubbling lava and formed a mist over the sluggish flow. Through the swirling clouds I caught glimpses of two ledges high above me: one was bricked, the other appeared to lead to the throne room I had been seeking.

A blast of fresh air cleared the mist near my feet and like a single gravestone a broken sign appeared momentarily. A dull gleam of gold showed at the base of the sign before being swallowed up by the fog again. From the distance came the angry buzz of the killer bees. Could I avoid their lethal stings as I had managed to escape the wrath of the dragon? Reading the sign might give me a clue to the dangers of this pit.

I approached the sign slowly.

And so it goes, hour after hour, as you guide your microcomputer through the Adventures of Scott Adams in an effort to amass treasures within the worlds of his imagination.

By definition, an adventure is a dangerous or risky undertaking; a novel, exciting, or otherwise remarkable event or experience. On your personal computer, Adventure is that and more.

For the user, playing Adventure is a dangerous or risky undertaking in that you better be prepared to spend many addictive hours at the keyboard. If you like challenges, surprises, humor and being transported to other worlds, these are the games for you. If you dislike being forced to use your common sense and imagination, or you frustrate easily, try them anyway.

In beginning any Adventure, you will find yourself in a specific location: a forest, on board a small spaceship, outside a fun house, in the briefing room of a nuclear plant, in a desert, etc.

By using two-word commands you move from location to location, manipulate objects that you find in the different places, and perform actions as if you were really there. The object of a game is to amass treasure for points or accomplish some other goal. Successfully completing a game, however, is far easier to state than achieve. In many cases you will find a treasure but be unable to take it until you are carrying the right combination of objects you find in the various locations.

How do you know which objects you need? Trial and error, logic and imagination. Each time you try some action, you learn a little more about the game. Which brings us to the term "game" again. While called games, Adventures are actually puzzles because you have to discover which way the pieces (actions, manipulations, use of magic words, etc.) fit together in order to gather your treasures or accomplish the mission. Like a puzzle, there are a number of ways to fit the pieces together; players who have found and stored all the treasures (there are 13) of Adventure #1 may have done so in different ways.

In finding how the pieces fit, you will be forced to deal with unexpected events, apparent dead ends and Scott's humor, which is one of the best parts of the puzzles.

If you run into a barrier like not being able to discover more rooms, don't give up. Play the game with some friends; sometimes they'll think of things you haven't tried.

While I pondered how to reach the throne room — which I was sure contained the treasures of Croesus — the fog grew thicker and the hours passed. I realized I would not be able to outwit Adams today...but maybe tomorrow. I marked my present location on my tattered map and began the long trip to the surface. As I dragged myself off to bed, I thought about other possible Adventures.

But enough for tonight. Tomorrow — another crack at the chasm.

The 12 Scott Adams Adventures

Adventureland • Pirate Adventure • Mission Impossible •
Voodoo Castle • The Count • Strange Odyssey • Mystery
Fun House • Pyramid of Doom • Ghost Town • Savage
Island-Part 1 • Savage Island-Part 2 • Golden Voyage

WHO ARE YOU THIS TIME?

Are you the seeker of lost treasures in an enchanted realm of magical beings? Perhaps you're an astronaut, thousands of light years from earth, searching the galaxy's rim for the fabulous treasures and advanced technologies of a long-dead civilization. Maybe you're the plunderer of ancient pyramids in a maddeningly dangerous land of crumbling ruins and trackless desert wastes.

Imagine.

You wish to soar to other worlds, to behold wonders never beheld by mortal eyes, to dream unrestrained to the furthest limits of your imagination.

Imagine now that you can.

The ADVENTURE SERIES by Scott Adams has been reviewed by every major microcomputing magazine, receiving only the highest praise for its mind-puzzling challenge & refreshing originality. Tens of thousands of adults and children have matched wits with the Adventure Master. Now, it's your turn. If you crave the challenge and panorama of the exotic, touched with sparkling humor, then the Adventure Series is for you.

With the incredible Adventure Series by Scott Adams,

Radio Shack's TRS-80® Color Computer Gives You the Graphics Advantage!

Radio Shack's TRS-80 is the powerful personal computer that makes sophisticated color graphics affordable! With our all-new accessories, you can create a complete graphics system that's ideal for use in business, education or engineering.

NEW! TRS-80 Multi-Pen Plotter. This intelligent plotter produces hard copy printouts in six colors using simple ASCII commands. At only \$1995, it's just what you need to produce attractive, professional looking graphic displays. Add our felt-tip pens and you can plot on transparencies for chart overlays and overhead projection. Features include multiple line styles, arcs, upper- and lower-case characters and symbols to enhance your graphics, plus our exclusive high-level graphic application package. This graphics

package lets *anyone* create line graphs, pie charts and bar charts for business or educational use — no experience is necessary!

NEW! Dual-Purpose Printer. The new \$399 TRS-80 Line Printer VII is a perfect low-cost choice for printing text — and its bit image mode lets you print superb dot addressable graphics in black and white! For word processing, data processing, and graphics, check out our new \$799 Line Printer VIII. Our \$4.95 Cassette Screen Print Program makes it easy to transfer the two-color high-resolution display memory contents of your Color Computer to either of these printers.

plans of any size. A swivel head lets you operate vertically, too. In fact, you can even input data directly from the surface of your computer screen or light table.

Great Graphics Made Easy! It all starts with our \$599 TRS-80 Color Computer. The 16K memory and extended Color BASIC lets you draw circles, rectangles, and boxes with simple, one-line commands. And you can add up to four disk drives, with the first only \$599!

Price Breakthrough! At just \$449, the new TRS-80 Digitizer is an economical and extremely convenient way to input your graphics. Measure areas, lengths, distances and more! And because it's not an ordinary graphics "pad," you can use it on maps, charts or

MACRO-MONITOR ...THE SHADOW

What secrets lurk deep within the heart of your microprocessor? Only THE SHADOW knows. Advanced Operating Systems shines the light on the intricate workings of your *TRS-80 Model I or Model III microcomputer. MACRO-MONITOR, THE SHADOW, is a machine language program by Jake Commander which allows you to disassemble and examine program instructions from any part of your computer's memory. THE SHADOW even enables you to single-step through your computer's ROM.

With THE SHADOW, you can load a machine language program from disk or tape and

begin execution at a user-specified breakpoint, one instruction at a time, with a user-defined time delay between instructions. It will disassemble each instruction as it is being executed and route it along with all current register values to your video screen or printer. The user may also search through memory for a specific character string (ASCII or Hex) up to 16 bytes in length.

THE SHADOW permits machine language programs to be relocated within memory with all internal calls and jumps changed to execute in the new location. The program also provides a visual display of tape LOADS and SAVES.

THE SHADOW is completely user-relocatable in RAM making it an extremely valuable tool for all programmers.

Now available at your local software retailer, or call (800) 348-8558 to order. (Indiana residents, call (219) 879-4693) MasterCard and VISA accepted.

Files and foibles

List linking

Model I, II and III

T. R. Dettmann, Associate editor

Computer scientists have provided us with many powerful techniques for dealing with files of information. Whole courses are taught in college on how to do this ("data structures" is the name of the topic). One of the most useful techniques, and one of the most common, is the linked list.

Richard Straw covered list linking techniques in the January 1982 issue for lists in memory. He indicated, however, that list linking was not very useful for disk files because of the "thrashing" that the disk will go through.

As a general rule, he is quite right. In the worst cases, a linked list can exist in such a way as to really give the disk drive a workout trying to access the records. However, there are still cases where list linking is not only useful, but very efficient for controlling disk files. Linked list techniques are also closely related to other structuring techniques which make random disk files much more efficient.

As an example of where a linked list can be useful, let's consider a job costing system which includes a variable number of job functions, from zero through 99, depending upon the job. If we set this up as a random access file, we could fix it so that every job has space for 99 functions, whether it uses them or not.

This is efficient from the standpoint of access to the functions, but unless most jobs have 99 functions, it will be a big waste of disk space. Let's say the average job has five functions, a few jobs have none or 10, and only a very few have greater than 10. In this case, we could improve our efficiency by setting up each job with enough space for five functions when it is created.

So what happens when we need more functions? A simple approach is to start another record, store five more functions there, and link it to the first with the linked list technique. Most jobs will have, at most, one link. Many jobs will have none. Only a few jobs will have to link together more than two records.

Efficient storage is a major problem. List linking can help. List linking can also be a real problem. Aside from the problem of "thrashing", which is very real, we can also get into problems if we don't want to access our list

in the order naturally provided by the links.

In our job costing example, we could always bring all job functions into memory when we need to work on the job. It is a simple technique and well worth the effort. But what if we used a linked list to store a mailing list? In a mailing list, we may want to retrieve everyone in alphabetical order. If we link every record into an alphabetical list, we can just follow the links and get everyone. But what if we want to change just one record?

In order to change one record in the file, we first have to find it. To find it, we search through the list starting with the first record. The one we want to change might be "Markson." It could even be stored in record number one in our file, but with a linked list, we wouldn't find it until we searched through the whole list up to that point. This is where thrashing becomes a problem. Let's see how a linked list works to see why this is so.

How it works

A linked list works by having each item in the list include a "pointer" which points to the next item in the list. This pointer is nothing but the disk address — the record number of the item. Figure 1 shows a simple list which is linked in numerical order.

The big advantage of the linked list is that it can add new items anywhere in the file and yet still have them recovered in a predetermined order. As with everything else in computers, you do not get something for nothing. In order to get convenience of retrieval, you have to store extra data (the pointers) and you have to take extra time to get it ready. Still, in some cases, it is worth it.

A simple example

To show list linking in a form other than that used in the January 1982 issue, let's consider this problem. Assume that we want to maintain a "To/Do" list (one of my favorite problems.) However, we want to maintain it on a monthly basis, with entries for each day we have something to do.

We could make a big list and sort it by day, but let's try something else. We will put a master pointer for each

Figure 1
A sample linked list.
Follow the arrows to follow the links.

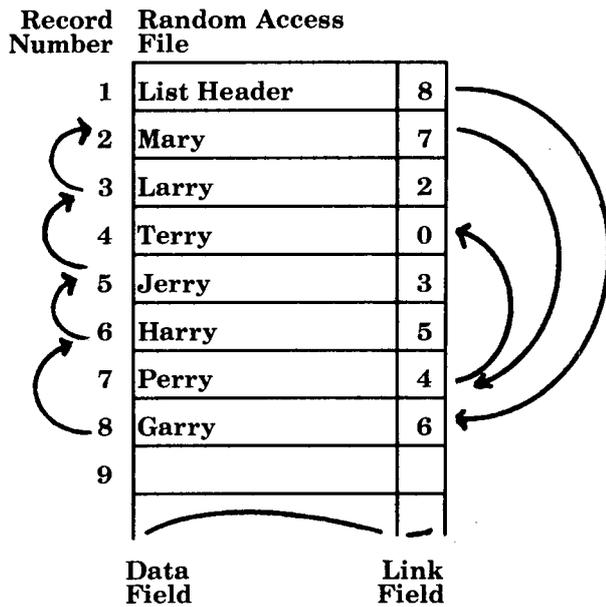

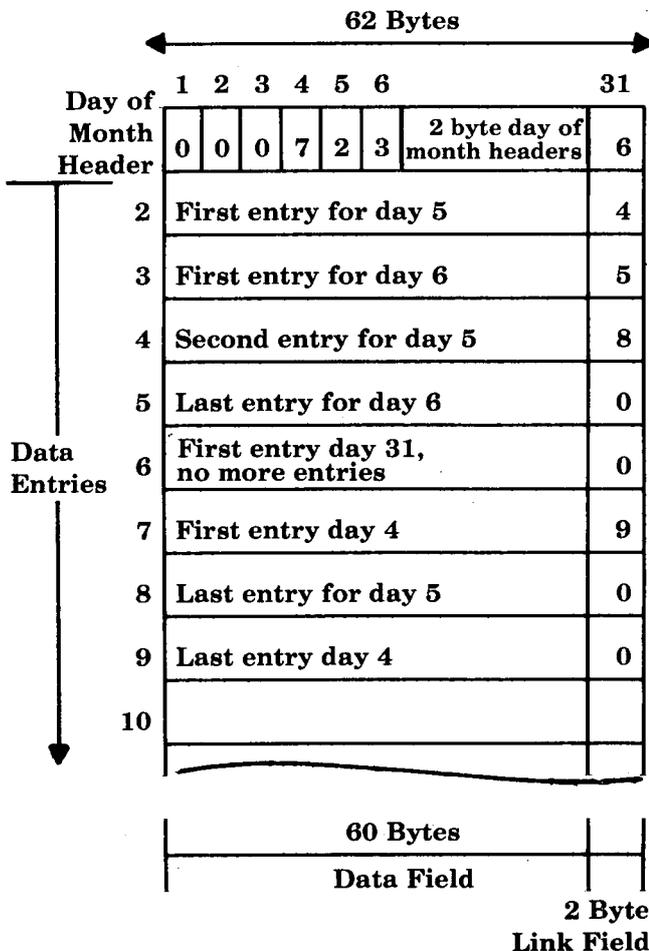

Figure 2

day of the month in the first record of a file. This pointer will point to (or remember) the beginning of a list of items to do. We will also store a pointer which points to the last item in each day's list (see figure 2). We will use this to simplify adding new things to the list.

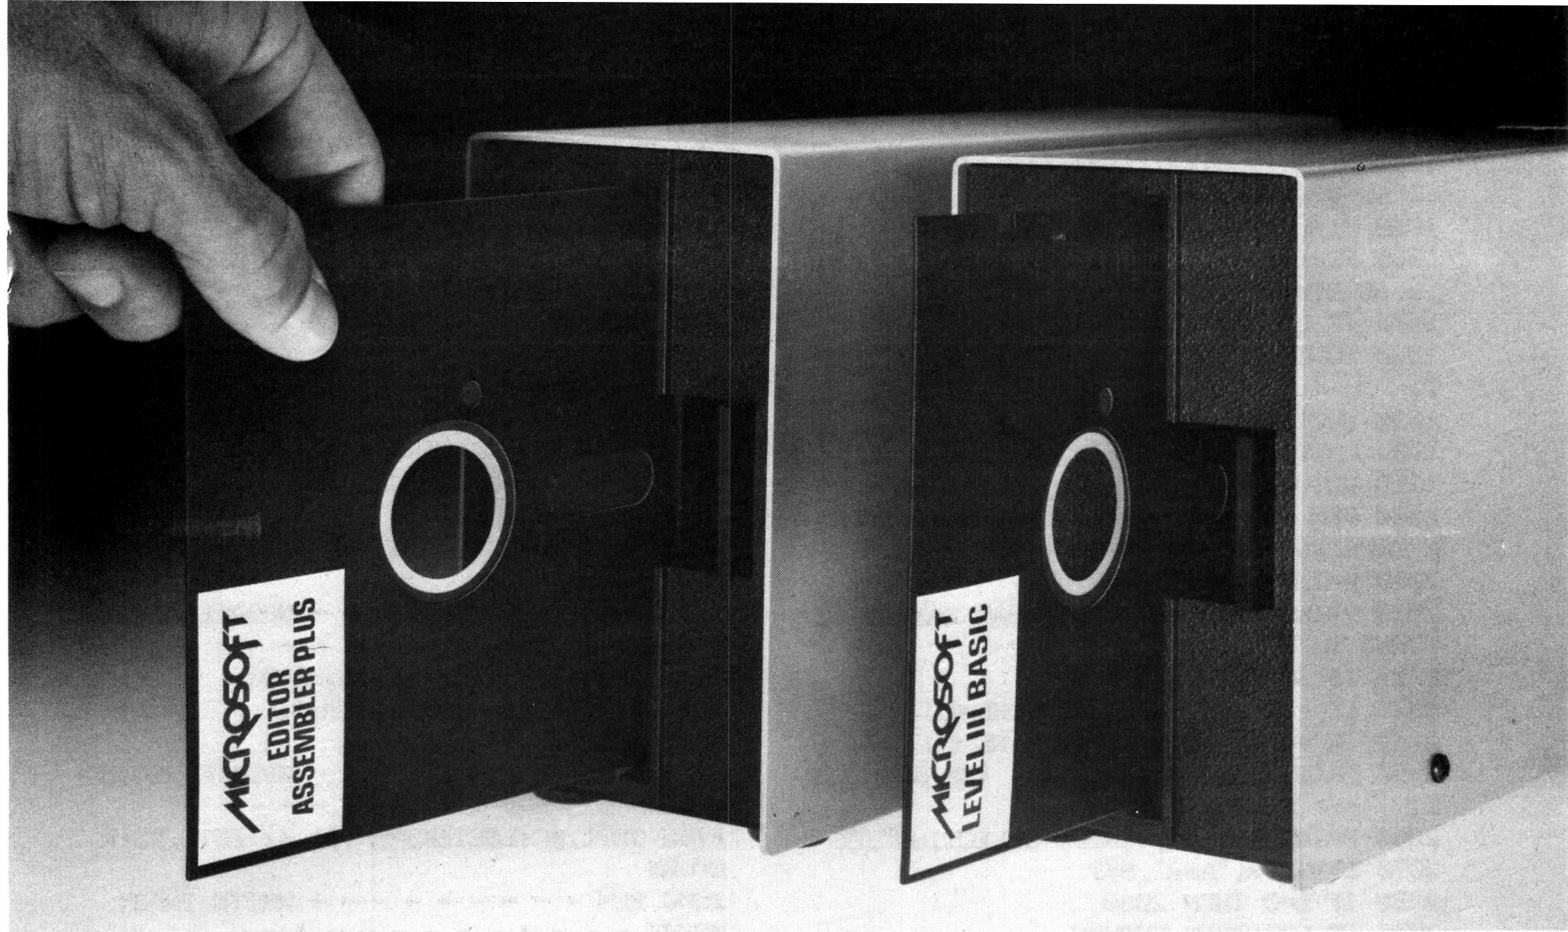

As we add to the list, we put the item in the first available space and then add it to the end of the appropriate day's list. When ready to print out a list for a given day, we simply follow the threads, printing each item as we get to it.

While thrashing is a problem, we would almost have to work at it to make it a serious one. The program listing included here illustrates a simple solution to the problem.

More powerful programming tools for the TRS-80.™ Now on disk.

Better results. Microsoft's Level III BASIC and Editor/Assembler-Plus are programming tools that help you write complex programs in less time, with less effort and utilizing less memory. Better programs. No matter what your programming skill. And for the first time these tools are available on disk.

Editor/Assembler-Plus. A powerful editing, assembly and debugging tool with many sophisticated features that make writing TRS-80 assembly language programs easier, faster and more efficient.

- Full disk capabilities.
- Assembly directly into memory. No need to save object code then reload for execution.
- Macro capability that allows you to define macros for commonly used sequences of instructions.
- Conditional assembly that allows you to generate more than one version of a program.
- Eight breakpoints at a time for program debugging.
- The INCLUDE statement that allows you to call additional disk files for assembly.
- Other features include extensive operators, automatic origin, symbol table printout, quash command, hex, decimal and octal constants, single step-through instructions in memory, five type-out modes, four type-in radices, plus extensive edit commands.

A more powerful BASIC. With Level III BASIC, you get power to perform tasks in BASIC that used to require assembly language. Plus, new ease-of-use features for your TRS-80.

- Advanced graphics. Develop charts, graphs, even animation in Level III BASIC. Draw a line, an outline box or

a solid box by specifying just two points. Then save and recall it with BASIC commands.

- MENU. One command that allows you to construct an entire menu.
- CHAIN and COMMON commands allow you to call another program and pass variables to it.
- Powerful editing commands such as COPY/TRANSFER, FIND and CHANGE.
- DUMP command that makes debugging easier.
- Time-limit response. New INPUT # LEN and LINE INPUT # LEN commands allow you to set a time limit on response.
- RS-232 output from BASIC. With a single command.
- More. Level III gives you automatic line numbering, 26 user-definable single stroke instructions, and more.

Disk or cassette. Disk versions of Level III and Editor/Assembler-Plus are brand new. Cassette versions are also available with many of the same capabilities.

Talk to your Microsoft™ dealer. Ask for a demonstration of two of the most powerful tools you can get for your TRS-80: Level III BASIC and Editor/Assembler-Plus. On disk or cassette. From Microsoft.

Color computer owners, 32K PLUS DISKS* \$298.00

Yes, that's right - for as little as \$298.00 you can add 32K of dynamic RAM, and a disk interface, to your TRS-80 Color Computer! If you just want the extra memory it's only \$199.00, and you can add the disk interface later for \$99.00.

Just plug the *Color Computer Interface (CCI)*, from Exatron, into your expansion socket and "Hey Presto!" - an extra 32K of memory. No modifications are needed to your computer, so you don't void your Radio Shack warranty, and Exatron give both a 30 day money-back guarantee and full 1 year repair warranty on their interface.

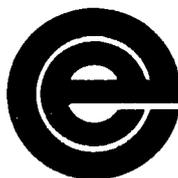

The *CCI* also contains a 2K machine-language monitor, with which you can examine (and change) memory, set break-points, set memory to a constant and block-move memory.

So what about the *CCI Disk Card*? Well as we said it's only an extra \$99.00, but you'll probably want Exatron's *CCDOS* which is only \$29.95 - unless you want to write your own operating system. The *CCI Disk*

Card uses normal TRS-80 Model I type disk drives, and *CCDOS* will even load Model I TRSDOS disks into your color computer - so you can adapt existing TRS-80 BASIC programs.

As a further plus, with the optional *ROM Backup* adaptor, you can dump game cartridges to cassette or disk. Once the ROM cartridge is on cassette, or disk, you can reload, examine and modify the software. The *ROM Backup* adaptor is only \$19.95.

For more information, or to place an order, phone Exatron on their Hot Line 800-538 8559 (inside California 408-737 7111), or clip the coupon.

Base conversions with the Pocket Computer

Pocket Computer

Peter G. Savard, Livonia, NY

For a person such as myself, one who gave up serious math at an early age, converting from decimal to hex and back can be a real chore. Shortly after I purchased my Model I, I wrote a program to do these conversions for me.

However, I soon found that no matter how many conversions I did before I loaded the program I was working on, there was always one more conversion I needed to make when my conversion program was not available. So, back to pencil and paper. Enter the Pocket Computer.

What application could I put this nifty little gadget to? Why not hex to decimal (and decimal to hex) conversion? In fact, why not a program which would do several of the little chores that a programmer needs to do. The program in Listing 1 is the result.

When you have entered the program, put the computer in the DEF mode and press SHIFT and SPACE. A menu listing the program options will be displayed. The options are: HEX → DEC — SHIFT H

Selecting this option causes ENTER HEX # to be displayed followed by ?#. Because there are no string functions in this BASIC, the digits of the hex number must be entered one at a time (four digits must be entered, e.g., 732A or 004F). After the last digit is entered, the program will process the number and beep to let you know it is doing something. In a few seconds, the decimal equivalent will be displayed. Press ENTER and you can do another number.

DEC → HEX — SHIFT D. The same process is followed in this section with the exception that the decimal number can be entered at once. Press ENTER and the program will process the number and display the hex equivalent with leading zeros.

POKE → PRINT — SHIFT S. With this option, you

are prompted to enter the POKE address. The PRINT@ value of that address will be displayed.

PRINT → POKE - SHIFT F. This is just the opposite. Enter the PRINT@ address and the POKE value of that address will be displayed.

POKE >32767—SHIFT G. Enter the value of address to be poked and the correct value to be poked will be displayed.

Although these are fairly simple calculations, I have found them to be a great time saver. I hope others find them that way also. Besides, it will give you something to do with your Pocket Computer.

GOSUB-RETURN

How subroutines work

Model I, II and III

T. R. Dettmann, Associate editor

So far in this series we have covered some simple things you can do in BASIC with a few limited statement types, but we have been limited primarily by programming technique. Just knowing the statements in BASIC isn't going to make good programs for you. You have to know how to use them.

One of the most important advances in programming came with the concepts of Modular and Structured programming. Don't worry, we aren't going to get all technical about just what these terms mean. What we will do is work out some practical techniques for programming based on the principles these techniques imply.

First, let's talk a little philosophy. Just what do we mean by "modular programming?"

What Is Modular Programming?

Writing computer programs is a fascinating hobby (and even *more* fascinating job). If you think about it, you will notice that computer programming is really nothing more than problem solving. Most computer programming courses fail to understand that and concentrate instead on the mechanics of a particular programming language.

The most significant activity in programming is the design of the problem solution: working it out in

such a way that it can be programmed on a computer. If we look at programming as problem solving, then it seems obvious that techniques we learned back in school for solving problems should also work for writing programs.

One of the very earliest techniques we all learned was that if you were faced with a *big* problem, it is better to break it into a number of smaller problems, and then solve each of those in turn. Solving all of the smaller problems adds up to a solution of the big one.

If the smaller problems are still too large to solve easily, we can break each of them down into still smaller ones. In programming, we call this "modularization." Modular programming involves nothing more than this technique of breaking a problem into small pieces. Each piece has a "module" of the program dedicated to solving its part of the problem.

Subroutines

Instead of writing several modules and threading them one after another to solve a problem, it's simpler if we can invent a "black box" that solves a problem and returns the solution to wherever we called it from.

BASIC provides a number of built-in functions like the SIN and COS functions that operate that way. We don't have to know how

they work. All we have to know is that by feeding them a number, we get back another number.

The key point here, is the ability to provide similar functions without having to know how they work inside. A subroutine is a way to write the same thing in BASIC.

A simple example of a frequently used routine in programs is a dead time loop. It is a short FOR...NEXT loop that does nothing but kill a few seconds of time whenever such time is needed. A dead time loop might look like this:

```
FOR TM=1 TO 500: NEXT TM
```

Many programs use loops like this repeatedly. We could write loops everywhere we wanted them, but if we design a single module to do this, we would be able to call it from any point without having to remember where we are. BASIC does this with the GOSUB statement.

GOSUB-RETURN

When we have a module, like the dead time loop, that we want to use at some place in the program, we can tell the program to execute and remember where it is by using a GOSUB. If the dead time loop is at line 500, we can run it by saying:

```
GOSUB 500
```

When BASIC executes the

GOSUB, it remembers where the program is, then it jumps to the subroutine and executes that. In order to get back to where we were in the program, we end the subroutine with the "RETURN" statement. This tells BASIC to go back to the place where the subroutine was called and continue the program from just after the GOSUB statement.

To get a feeling for how this works, look at the sample program. We have defined a number of subroutines which print out their designation when they are executed. Several even call other subroutines. The program also turns on the trace feature of BASIC (TRON), which causes each line's line number to be printed on the screen as the line is reached for execution.

Type and run the program, then make a list of each line number and print statement as they are reached. Use a listing of the program to follow its execution. This should help you see how the GOSUB actually remembers where it was last. In fact, it can even remember when one subroutine calls another.

Program to illustrate GOSUB

Sick of the same TRS-80 software?

Here's a CHEAP CURE!

The prescription for the Model I and III:
CLOAD Magazine!

A CASSETTE TAPE with 6 to 8 programs a month!

Some past sensational medications:

- Game — Caterpillar, Suns, CIA Adventure, Reversi.
- Practical — Securities, Energy, Tape Directory, Checkbook.
- Utility — Variable Dump, Display, Edit, Code It.
- Tutorial — Planets, Spell Egg, Atomic Table, Geometry.

At about **75 cents** a program, a subscription to **CLOAD Magazine** is just what the doctor ordered.

The Bottom Line:

1 year (12 issues)	\$42.00
6 months (6 issues)	\$23.00
Single copies	
Back issues	\$ 4.50
Good Games #1	\$12.00
Adventures #1	\$13.00

*Temperature and prices rising July 1, 1982

California residents add 6% to single copies
North America — First Class Postage Included
Overseas — add \$10 to subscriptions, and \$1 to single copies. Sent AO rate.

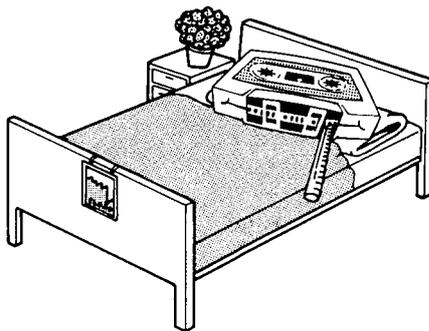

The Fine Print

All issues from Oct '78 on available — ask for list (24 Level I issues also). Programs are for 16K Level II, 16K Model III, and occasionally for disks. **TRS-80** is a trademark of Tandy Corp. MasterCard/Visa welcome!

CLOAD Magazine Inc.
P.O. Box 1448, Santa Barbara, CA 93102 (805) 962-6271

Circle # 28

**For the Extended BASIC COLOR COMPUTER
POCKETBOOK SURGERY NOT REQUIRED**

Is your CoCo table-ridden, drinking up electrical juice but not getting any software solids? A prescription of **CHROMASETTE Magazine** will stop the hardening of the ribbon cables.

The doctor explained that **CHROMASETTE Magazine** is a cassette tape with 6 to 8 quality programs on it. A healthy mixture of games, tutorials, utilities, and practical programs to nurture your computer every month. No finger exercises necessary. Just load and run.

Keep CoCo's health costs low. A subscription to **CHROMASETTE Magazine** is good, cheap medication (under 75 cents a program).

The Bottom Line:

1 year (12 issues)	\$45.00
6 months (6 issues)	\$25.00
Single copies	\$ 5.00

Calif. residents add 6% to single copies.
North America — First Class Postage Included.
Overseas — add \$10 to subscriptions, and \$1 to single copies. Sent AO rate.

MasterCard/Visa welcome!

The Fine Print:

All issues from July 81 on available — ask for list. Programs are for the Extended BASIC model only.

MasterCard/Visa welcome!

Spaceship Orbitor

A realistic orbital mechanics simulation with graphics

Model I/III, 16K and up

Delmer D. Hinrichs, Washougal, WA

Are you tired of the ordinary "Lunar Lander" and want to try something a little more realistic? Do you want to actually learn something about orbital mechanics? Then try this program!

Program Organization

This program is intended to give an accurate simulation of the action of a spaceship in orbit. To do this, it is necessary to calculate true inverse square-law gravity. This means that the acceleration of gravity is proportional to the mass of the primary divided by the square of the distance from the spaceship to the center of the primary. Since the effect of gravity during the whole segment must be simulated, the effective position of the ship for the entire segment is taken to be the center point of the segment. This position is estimated by projecting the ship's velocity ahead for one-half of the segment time, then since this position would always lie outside of the true orbit, making a further correction.

If the rocket engine of the spaceship produces a constant thrust, the resulting acceleration will increase as the fuel is burned and the total mass of the ship decreases. This effect is accurately simulated in this program by using the correct logarithmic equation for the velocity change due to the rocket burn.

The position of the spaceship is most conveniently calculated and stored in terms of its X and Y coordinates, with the center of the primary as the origin. Likewise, the spaceship's velocity is used as X and Y vectors. Both position and velocity are maintained in double precision form, necessary for a smooth landing. Since normally there is little change for each segment,

the updating of velocity for gravity and for rocket burns is calculated in single precision. The accuracy of this approach is good; over one complete orbit, the calculated position of the ship remains within a couple of meters of its theoretical position.

The impact of the spaceship with the surface of the primary will normally occur during one of the calculation segments; the impact conditions are then interpolated from the segment-end conditions immediately before and after impact.

All user entries and program displays are in polar coordinates (direction and magnitude), which are easier to visualize than the X, Y coordinates used for calculations. Keep in mind that all directions are expressed in degrees, in the zero to plus or minus 180 degree convention.

The program has fairly complete entry checking and error trapping. Most errors will not stop program operation, but will display an error message and allow you to continue. An exception is reading bad data from tape when trying to restore the ship's previous status. Since the program has no current ship's status to return to, it cannot continue.

The program listing is fairly well supplied with remarks to assist in figuring out what is being done in each part of the program.

Running the program

After you have loaded the program into your computer and entered RUN, it displays a title and asks if you want instructions. (Note that any required single-character user entry gives instant response without

If you *liked* MICROPROOF, then you'll *love* SON OF MICROPROOF:

ELECTRIC WEBSTER™

The ultimate spelling checker.

EASY TO USE:

Enter the appropriate command, and ELECTRIC WEBSTER proofreads your document, displaying misspellings and typos on the screen. Then correcting ELECTRIC WEBSTER can display each error separately, requesting you to enter the correct spelling for each. You are also given the option of displaying errors in context or adding words to ELECTRIC WEBSTER's 50,000 word vocabulary. If you do not know the correct spelling you may also ask ELECTRIC WEBSTER to look it up for you. Finally, ELECTRIC WEBSTER corrects your document. All in less than a minute.

LOW PRICES:

Standard MICROPROOF is available on TRS-80 Model I or II for \$69.50. Standard ELECTRIC WEBSTER is available for either \$89.50 (TRS-80 Model I or III, Apple) or \$149.50 (CP/M, TRS-80 Model II and all others). The optional correcting feature can be added at any time for an additional \$60. Correction feature can be ordered with a patch to operate directly from your word processing software. For each patch, optional Grammatical Checking feature, or optional Hyphenation feature, add \$35.

SELECT APPROPRIATE RESPONSE:

CORRECT MISPELLED WORD:	ENTER CORRECT WORD
LEAVE WORD "AS IS"	HIT <ENTER> KEY
DISPLAY WORD IN CONTEXT:	?
DISPLAY DICTIONARY:	@
ADD WORD TO DICTIONARY:	*
EXIT:	!
WORD:	(Your error)
RESPONSE:	

WHAT THE EXPERTS SAY:

"MICROPROOF" ... should be obtained by anyone who uses a word processor."
M. Tannenbaum, CPA, 80 Microcomputing, 8-81
"One word—Excellent."
Program Previews, Computronics, 9-81
"In a comparative review... MICROPROOF was found to be faster than all the others."
P. Lemmons, BYTE Magazine, 11-81
"Any person able to use a word processing program can master it in moments."
F. Derfler, Info-World, 1-82

IMPROVED:

- One-step proofing and correcting.
- Lists errors to screen or printer.
- Can display errors in context.
- Can display dictionary to locate correct spellings.
- New precise symbolic dictionary will not miss an error.
- Remarkably compact (50,000 word dictionary will fit on one 5 inch disk).
- Even FASTER than MICROPROOF (formerly the fastest available).
- Simple Grammatical Checking (Optional Feature).
- Hyphenates automatically (Optional Feature available for some Word Processing programs).

Circle # 30

depressing the enter key.) If you press Y, a concise 15-line set of instructions is displayed; if you press N, the program bypasses the instructions and lets you select one of eight solar system primaries, or lets you return to a situation you had previously saved on cassette tape. If you pressed neither Y or N in response to the "Instructions?" question, an error message is displayed, and you may try again. Throughout the program, any detectable entry error is caught and corrected, or a retry is allowed.

The eight possible primaries that were chosen have little or no atmosphere; a landing on Earth, for example, would involve aerodynamic calculations which are excessively complicated. Of the eight, Mars is the most difficult to land upon due to its relatively high gravity, while Europa is the easiest. Therefore, for a landing on Mars you are given five times as much fuel as for a landing on Europa. In all cases, there is a considerable excess of fuel allowed. Io, Europa, Ganymede and Callisto are the four largest moons of Jupiter, while Titan is the largest moon of Saturn.

After you have chosen a primary, the program asks if you want a graphic or tabular display. The graphic display is in two stages. It first shows the progress of the ship in orbit, as shown in figure 1. Later, when the ship is near to landing, it shows a 10 km high by 20 km wide area near the landing site (see figure 2). Only the current status of the ship is shown at the top of the display. The tabular displays, in contrast, shows as many past segments of the ship's status as will fit on the video display (see figure 3). As the status segments scroll up,

the heading remains in place. For orientation, the tabular display initially shows a graphical display of the position of the ship in orbit, but this is cleared before actual piloting begins.

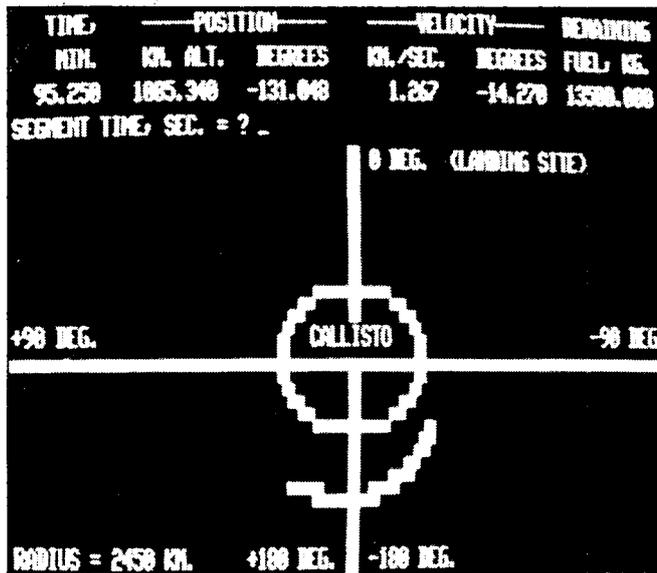

Next, you may either enter a seed number of the BASIC RND function, or let the computer choose one. If you enter a seed number, entering the same seed number will always give the same initial status for the ship (if the same primary was chosen), so that a previous landing trial may be repeated. The computer will choose a different initial status each time.

After the spaceship's position and orbit have been selected, piloting begins. You are first asked to enter the segment time. This is the simulated time that elapses between each evaluation and display of the ship's status. It may be any integer or decimal number of seconds up to 60 seconds. The default value (value used by the program if ENTER is pressed without a numerical entry) is 60 seconds. To gain access to the "On-board computer" (explained later), enter "99" as the segment time.

Next, the program asks for the number of segments, whose duration was specified above, to be calculated. This may be any integer number up to 32767. The default value for the number of segments is one. It is often convenient to enter a large number for the number of segments to be calculated, watch the progress of the ship on the display, then stop calculations when things have gone far enough by pressing any key.

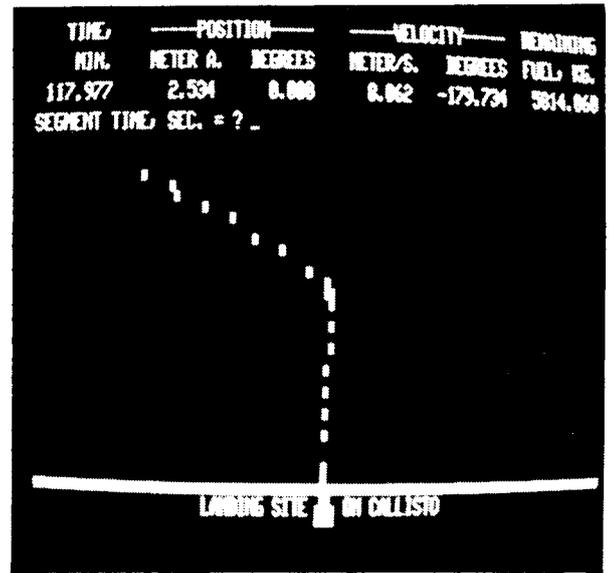

The program next asks for the fuel burn-rate to be used. This may be any integer or decimal number of

Feature program

A graphic display of a landing in progress on Callisto. The current status of the ship is shown at the top of the display, and the orbit path is shown graphically.

kilograms per second (kg/second) up to 100 kg/second. The default value is a zero burn rate, or free-fall. Note that three quick presses of ENTER, without any numerical entries, gives one 60-second free-fall segment.

A graphic display of a landing almost completed on Callisto. The current status now shows meters altitude and meters/sec. velocity. The position of the ship at the end of each segment is shown graphically on a 10 km. high by 20 km. wide display.

If the burn rate was not zero, the program next asks for the direction of thrust for the rocket burn, in degrees. The directions are the same as those shown on the graphics display. The default value is zero degrees, or straight up if the ship is in the final stages of landing at

Color Computer
News

Are you tired of searching the latest magazine for articles about your new Color Computer? When was the last time you saw a great sounding program listing only to discover that it's for the Model I and it's too complex to translate? Do you feel that you are all alone in a sea of Z-80's? On finding on ad for a Color Computer program

did you mail your hard earned cash only to receive a turkey because the magazine the ad appeared in doesn't review Color Computer Software? If you have any of these symptoms you're suffering from Color Computer Blues!

But take heart there is a cure!
It's COLOR COMPUTER NEWS.

The monthly magazine for Color Computer owners and only Color Computer owners. CCM contains the full range of essential elements for relief of CC Blues. Ingredients include: comments to the ROMS, games, program listings, product reviews, and general interest articles on such goodies as games, personal finances, a Kid's page and other subjects.

The price for 12 monthly treatments is only \$21.00 and is available from:

VOLUME I

The most complete book yet on the math routines of the BASIC ROM, Models I & III. Contains a wealth of detail about integer, single and double precision formats, advanced math, data manipulation, and assembly language interfacing, with examples. Includes commented listing (0708H-1607H), plus a highly detailed map of the ROM and reserved RAM.

VOLUME II

Packed full of useful information on the model I input/output routines, with detailed listings to illustrate the commented source code. Learn to control and manipulate the keyboard, video, printer port, and cassette port. Essential for assembly language programmers, you can write your own routines or use the many programming examples included.

Feature program

- JR Random seed for middle byte
- K Integer FOR loop counter
- KR Random seed for low byte
- L Lines of ship's status displayed
- LD Near landing flag, 1=yes
- LG Landing graphics background flag, 1=yes
- M Ship's mass without fuel — 10,000 kg.
- N User entry selection number
- NA No good angle flag, 1=yes
- NG Orbit graphics background flag, 1=yes
- NS Number of segments
- O\$ "Orbit" — to check recalled status file
- PI Pi — 3.14159
- PX New "X" position
- PY New "Y" position
- Q Radius correction factor; square of radius
- QA Angle of gravity
- R Ratio, ship's new radius
- RA Ratio for impact status interpolation
- RB Rate of burn of rocket engine
- RD Radius from ship to center of primary
- RF Final segment radius after impact
- RG Radius for gravity
- RI Initial segment radius after impact
- RS User entry random seed
- R0 Radius of equivalent circular orbit
- S Temporary radius
- SM Ship's total mass
- SN Ship's new total mass
- SR Surface radius of primary, random seed temp #
- ST Segment time
- S2 One-half of segment time
- TM Elapsed time
- VG Delta velocity due to gravity
- VL Ship's velocity
- VX New "X" velocity
- VY New "Y" velocity
- XG "X" velocity to estimate gravity
- XI "X" impact velocity
- XP "X" position
- XR "X" velocity after rocket burn
- XV "X" velocity
- YG "Y" velocity to estimate gravity
- YI "Y" impact velocity
- YP "Y" position
- YR "Y" velocity after rocket burn
- YV "Y" velocity
- Z\$ User entry

MONEY MAGIC!

doughflo™

DOUGHFLO. The Most Useful Program a Home or Business Manager Can Have!

Designed For The Decision Maker, Doughflo is an interacting system of programs for cash flow analysis, budget planning, and bookkeeping.

In The Home, Doughflo becomes a key tool in solving the puzzle of balancing expenses vs. income. Doughflo shows you where the money goes.

Fire Your Bookkeeper! You, the new bookkeeper, will have easy access to all expense records. Rapidly find and display any number of entries by description, type, amount, date, or number.

Simple To Use, Doughflo is quick and efficient, carefully guiding you from data entry to report generation.

User Friendly input screens and single keystroke commands allow quick and easy data entry and computer interaction.

Amazingly Versatile! Indispensable in home or business for:

- Budget Planning
- Tax Preparation
- Bookkeeping
- Financial Analysis

Gain Valuable Insight. Doughflo is ready to save you time and money. Requires 32K and one or more disk drives, specify Model I or III. \$98.95 postpaid to continental North America. For more information check reader service number.

**"A
PERFECT
CLOAD
EVERY
TIME"***

tape digitizer™

*From a review in September-October 1980 Elementary Electronics. Reprints available upon request.

At last there is a cure for TRS-80 tape cloading blues! For over three years, Alphanetics has been selling the TRS-80 Tape Digitizer, a proven hardware solution for your software problems. No longer need you juggle the recorder's volume control endlessly, trying for a perfect cload of a pre-recorded program. Just pop the tape into the cassette recorder, process the signal through our digitizer, and you're ready to RUN a perfect load!

Just check out the Tape Digitizer's features . . .

- Makes tape program loading virtually independent of volume control setting.
- Allows copying system and normal tapes without using computer.
- Makes a perfect digital copy of any tape without using computer, removing hum, noise, and cures minor dropouts.
- Cassette switch allows manual control of cassette recorder, independent of computer control.
- "GOOD DATA" indicator easily enables setting proper volume . . . doubles as a tape monitor.
- A.C. powered — no batteries to replace.
- Housed in a sturdy, attractive metal case.
- Completely compatible with Level I & II, also LOW speed [500 baud] Model III.

Circle # 34

Feed your cassette to the Alphanetics Tape Digitizer and feed your computer the exact digital waveform the TRS-80 gave your tape. Get rid of your tape bugs today — \$64.95 postpaid to continental North America, or return within 10 days for a full refund!

Feature program

being calculated, your impact status will be displayed as shown in figure 4. Note that when your altitude from the primary's surface becomes less than 10 km the altitude display changes from km to meters, and the velocity display changes from km/sec. to meters/sec. This makes it easier to give the fine control needed for a soft landing.

The on-board computer

This feature allows you to calculate some of the celestial mechanics values that you need to do a good job piloting (or to save the spaceship's current status on cassette tape). During calculations, the ship's current status is shown at the top of the display for reference, and the "initial" entry values default to the ship's current status. The four possible calculations are:

1. Hohmann transfer
2. Orbit analysis
3. Delta velocity to change ship's velocity and direction.
4. Required fuel usage for a given delta velocity.

In addition, you may save the ship's current status on cassette tape, end calculations and return to piloting or exit from the program and return to BASIC.

The Hohmann transfer is a minimum-fuel usage maneuver to go from a circular orbit at one altitude to a different circular orbit at a higher or lower altitude. Such a transfer requires two separate rocket burns, on

opposite sides of the orbit. If you are going from a higher to a lower orbit (as for preparing to land from orbit), the first rocket burn is made so as to slow the ship down to the initial transfer orbit velocity, and also leave it traveling in an exactly horizontal direction (the ship's position angle plus or minus 90 degrees). Then free-fall until the ship is exactly half-way around the orbit from the position of the first rocket burn (position angle change of 180 degrees). At this lowest point on the transfer orbit, make a second rocket burn exactly opposite to the ship's velocity direction to slow down to the circular orbit velocity at this new altitude. Actually, for making a landing this second rocket burn would normally be made approximately over the landing site, and would be continued long enough to stop all horizontal velocity.

To use the Hohmann transfer routine, key in the initial altitude (or just press ENTER to use the ship's current altitude), then key in the desired final altitude (default, zero altitude). Eight values will then be displayed. The circular orbit velocity at the initial altitude, the delta velocity (change in velocity) to initiate the Hohmann transfer, the initial Hohmann transfer orbit velocity, the time required to make the transfer, the final transfer orbit velocity, the delta velocity required to circularize the orbit at the new final altitude, the circular orbit velocity at the new altitude and the total delta velocity required for the maneuver. Delta velocities which are negative mean to slow down,

while positive delta velocities mean to speed up.

The orbit analysis routine will determine the minimum altitude of the orbit and the minimum altitude position. It will also calculate the velocity and altitude at any other position angle on the orbit. This is very useful for helping to decide what to do.

To use the orbit analysis routine, either key in the four values that define the ship's position and velocity, or just press ENTER four times to use the ship's current status. The display will then show either "Elliptical orbit" or "Hyperbolic orbit" for the ship, and also the position angle and altitude of the orbit minimum. The routine will then ask for a new position angle. When you enter an angle (default is zero), the display will show the altitude and velocity of the orbit at this new position angle. For hyperbolic orbits, it may happen that no orbit exists at the entered position angle.

The delta velocity routine calculates the direction and magnitude of the velocity change required to adjust the ship's trajectory from one direction and speed to a different direction and speed. This is essentially a two-dimensional vector subtraction.

To use the delta velocity routine, key in the initial velocity angle and magnitude (or just press ENTER twice to use the ship's current velocity), then key in the desired final velocity angle and magnitude. The display will then show the velocity angle and magnitude required to change the ship's velocity from the initial status to the new status.

The fuel usage routine calculates how much fuel must

be burned to give the ship the desired delta velocity. This usage depends upon the total mass of the ship and upon the rocket exhaust velocity (assumed to be 4km/sec. for the hydrogen/oxygen fuel that the spaceship uses).

To use the fuel usage routine, key in the ship's mass (or just press ENTER to use the ship's current mass), then key in the delta velocity. The display will show the fuel usage required to give that delta velocity.

The ship's current status may be saved on cassette tape either to continue the problem at a later time or to insure that the failure of a "dangerous" maneuver does not make it necessary for you to start over from the beginning. After the ship's status has been saved on tape, it may be recalled at any time by exiting from the program, then entering RUN to restart the program and selecting the "Recall previous status" option instead of a primary.

Remember when using the "On-board computer" that its calculations are single precision, and therefore will not agree exactly with the actual motion of the spaceship.

When you are through using the On-board computer routines, you may either return to piloting the spaceship or exit from the program and return to BASIC.

Efficient piloting

Theoretically, the most efficient (lowest fuel usage) way to make a landing from orbit is to wait until the ship is at a position angle of 180 degrees (directly

ALL HARDWARE Model I Lowercase

TRS-80 is a Trademark of Tandy Corp.

DUALCASE

UPPER/lowercase, full time from power-up; NO software; Standard typewriter keyboard operation (shift to UPPERCASE); Control characters can be displayed; 128 Total character set plus full graphics.

ELECTRONIC SHIFT-LOCK

No extra keys or switches. Simply tap either shift key, UPPERCASE lock, normal shift unlocks.

DEBOUNCE

If dirty keys are a problem, this is for you.

BLOCK CURSOR

Easier to locate on a full screen.

SHORT CASSETTE LEADER

For tape based systems.

SWITCHABLE

Disable from key board

"THE PATCH" is compatible with any word processor, any DOS and also other languages which use ROM sub-routines.

"THE PATCH" unit plugs into the ROM sockets (does not replace existing ROM). Lowercase does require installation of the extra video RAM (supplied with "THE PATCH").

Detailed instructions guide even the most inexperienced owner to complete installation in about 30 minutes.

Assembled and tested \$127.00
Texas residents add 5% sales tax.

WHEN ORDERING SPECIFY "Mem Size" [] "Memory Size" []

NOW—A MODEM AND MUCH, MUCH MORE!

AUTOTERM—The ultimate TRS-80[☆] terminal package that exploits the full capabilities of your computer and the MICROCONNECTION[™] with Autodial/Autoanswer. It has ALL the features of the "other" smart terminal programs, plus:

- Dials MICROCONNECTION[™] from terminal
- Allows full I/O translation
- Complete modem control and handshaking
- Paged screen scrolling
- Spooled printer output
- Parity, overrun and framing errors status
- Fully user-configurable
- Includes 77-page manual
- Text editor and hex conversion utilities
- Requires TRS-80 Model I or III, 32K and 1 disk drive
- Price—\$99.50. Documentation alone—\$15.00

SMART SERIES SOFTWARE FROM THE MICROPERIPHERAL CORPORATION

All terminal programs feature manual or automatic upload/download, two user-defined messages, auto prompt message entry, transfers EDTASM and Orchestra-80 files, formats screen line length, file transfer speed selection, upper/lower case drivers, auto-repeat key, "beep" function for keystroke entry, buffered print output, compatible with SCRIPSIT and PENCIL. Comes with text generator for those who do not have a word processor.

SMART 80D (disk)—\$29.95 purchased alone or FREE[★]
Requires Model I 32K plus one disk drive. Available for both RS232 and Buss-decoding MICROCONNECTION[™].

SMART 80C (cassette)—\$29.95 purchased alone or FREE[★]
Requires Level II 16K-48K system. Available for both RS232 and Buss-decoding MICROCONNECTION[™].

SMART 80E (wafer)—\$29.95 purchased alone or FREE[★]
The first and only smart terminal program for the EXATRON "Stringy Floppy." Requires Level II 16K plus one ESF drive.

SMART IIID (disk)—\$49.95 purchased alone or \$20.00 with purchase of MICROCONNECTION.
The FIRST smart terminal program for the Model III. Offers popular features of SMART 80D plus several new features associated with the Model III. Requires Model III 32K plus one disk drive and RS232 board.

SMART IIIC (cassette)—\$29.95 purchased alone or FREE[★]
The FIRST cassette-based smart terminal program for the Model III. All the power of SMART 80C plus numerous other features. Requires Model III Level II 16K plus RS232 board.

[★]One software package included with the purchase of each MICROCONNECTION[™].

How to Buy or Sell Computer Equipment and Software

Computer Shopper is THE nationwide magazine for buying, selling and trading Micro and Mini-computer equipment and software. Each issue has over 60 pages full of bargains of new and used equipment.

You can save hundreds of dollars by getting the equipment you need from the hundreds of classified ads individuals place in Computer Shopper every month.

Now is the time for you to join over 20,000 other computer users who save time and money with a subscription to Computer Shopper.

Subscribe today and get your first issue and a classified ad absolutely FREE. Type or print your ad on a plain piece of paper and send it along with your subscription.

Just fill in the coupon or MasterCard or VISA holders can phone **TOLL FREE 1-800-327-9920** and start making your computer dollar go further today.

Cut out and mail to: **COMPUTER SHOPPER**
P.O. Box F115 • Titusville, FL 32780

Yes, I'll try Computer Shopper, I understand that if I'm not satisfied with my first issue I can receive a full refund and keep the first issue free.

- 1 year \$10.00 (\$30.00 in Canada)
- I have enclosed my free classified ad.
- I want to use my free ad later, send me a coupon.

The Color Computer grows up

Adding a disk system

Color Computer

Don Scarberry, Editor

There have been many new peripherals made available for the Color Computer which turn this little wonder into much more than the simple game machine it was thought to be. Radio Shack has confirmed their original claim of added support by introducing disk drive capability and a complete DOS (Disk Operating System) contained in a small ROM (Read Only Memory) cartridge. The ROM cartridge plugs directly into the computer's expansion port. If you own a Color Computer and have been wondering what advantages a disk system will provide compared to a cassette recorder, then read on.

The first and most obvious advantage of owning a disk drive is speed. Loading and saving program (or data files) using a cassette recorder is at best cumbersome. Your file must be stored on the cassette in sequential order along the entire length of the tape. If you need to load a file which is physically located near the end of the tape, you must wait for the recorder to travel past all other files before it can be loaded. If your file is sitting near the end of a C-60 cassette you will wait nearly 25 minutes before it can begin loading. Shorter cassettes will help improve loading time but at the expense of storage space. If you use C-10 cassettes your maximum access time will be approximately 0.1 to 5 minutes depending on the length and location of the file. That is still a long time when you are sitting idly waiting for something to happen. By comparison, a disk drive will allow much faster access to any file on a diskette without loss of storage capacity. File access time is measured in seconds rather than minutes.

Storage space on a single diskette will vary according to your computer and disk drive

capabilities. You may already have heard the expressions "single density", "double density", "35-track", "40-track", and "80-track". These terms are indicative of the amount of storage space provided on a given diskette by your particular equipment. Radio Shack has provided the new disk drives for the Color Computer to be 35-track, double density. A track can be thought of as analogous to a groove in a stereo record. Each track contains 18 sectors consisting of 256 bytes each, or $18 \times 256 = 4,608$ bytes per track. One track is used by the disk drive for the directory (list of your files). This leaves $34 \times 18 \times 256 = 156,672$ bytes of storage on one diskette for your files. So what's a byte? Think of it as one letter of the alphabet. You can store approximately 156,672 characters on one 35-track double-density diskette depending on your methods of storing files.

In addition to increased storage space and speed which the disk will bring to your Color Computer, the TRSDOS operating system will provide many new commands. These commands offer much more power and flexibility than is found on the cassette-based system. The following table lists all the new commands available with the disk system. It must be noted that these are additional commands. You may continue to use any of the usual extended BASIC color commands.

Table 1

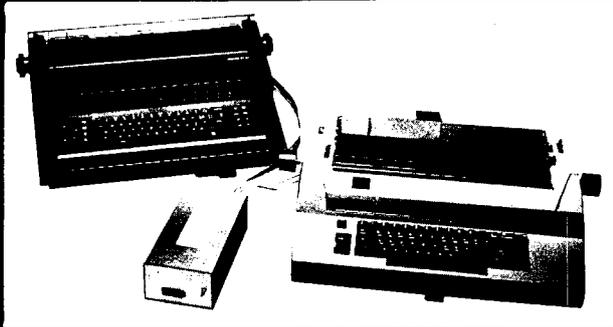

BACKUP the contents of the source drive to the destination drive.

CLOSE closes communication to the buffers specified.

COPY copies the contents of filename 1 to filename 2.

Hardware evaluation

CVN converts a 5-byte coded string (created by MKN\$) back to the number it represents.

DIR displays a directory of the disk in the drive number you specify.

DRIVE changes the drive default to the drive number you specify.

DSKINI formats a disk in the drive number you specify.

DSKI\$ inputs data from a certain sector within a certain track on the disk.

DSKO\$ outputs string data into the sector, track and drive number you specify.

EOF returns a 0 if there is more data to be read in the buffer and a -1 if there is no more data in it.

FIELD organizes the space within a direct access buffer into fields.

FILES tells the computer how many buffers to reserve in memory and the total bytes to reserve for these buffers.

FREE returns the number of free granules on the disk in the drive number you specify.

GET gets the next record or the record number you specify, and puts in the buffer.

INPUT inputs data from the buffer you specify and assigns each data item in the buffer to the variable name you specify.

KILL deletes the filename you specify from the disk directory.

LINE INPUT inputs a line (all the data up to the ENTER character) from the buffer you specify.

LOAD loads the BASIC program file you specify from a disk into memory.

LOADM loads a machine-language program file from disk.

LOC returns the current record number of the buffer you specify.

LOF returns the highest numbered record of the buffer you specify.

LSET left justifies the data within the field name you specify.

MERGE loads a program file from disk and merges it with the existing program in memory.

MKN\$ converts a number to a 5-byte coded string, for storage in a formatted disk file.

OPEN opens a place in memory called a buffer which will communicate data to and from a certain device.

PRINT prints the data to the buffer.

PRINT # buffer, USING format; data list. Prints data to the buffer using the format you specify.

PUT assigns a record number to the data in the buffer.

RENAME renames a file on disk to a new filename.

RSET right justifies the data within the field name you specify.

RUN loads filename from disk and runs it.

SAVEM saves a machine language program beginning at first address in memory and ending at last address.

UNLOAD closes any open files in the drive number you specify.

VERIFY ON

VERIFY OFF turns the verify function on and off.

WRITE writes the data to the buffer you specify.

Hardware evaluation

If you are only accustomed to using the cassette-based model and upgrade to the new disk system, you will feel like you have a tiger by the tail!

Another nice feature of the TRSDOS operating system is that it is transparent to the operator. You are actually operating in TRSDOS and BASIC simultaneously. You won't have to continually issue new commands to switch back and forth from BASIC to TRSDOS and vice-versa. Model I or III owners will appreciate this feature. For example, if you wish to load a program from cassette and store it on disk you simply type "CLOAD(filename)" ENTER and then when the program is loaded, type "SAVE (filename)" ENTER. You can switch files back and forth between cassette and disk with absolutely no effort at all. Your programs may also control input/output between these two devices. Combine all this flexibility with the graphics capabilities of the Color Computer and you will have a very powerful system. In fact, a two-disk system provides more storage area than four disks did in the earlier Model I — and you can expand your Color Computer to a total of four drives!

The TRSDOS for the Color Computer resides in a ROM cartridge which plugs into the expansion port. This causes the operating system to grab approximately 2500 bytes of your memory away from the computer. If you have only a 16K machine (13095 bytes of actual available memory), you will have slightly over 11K of memory available for program use when using the disk system. Software which formerly required more than 11K to operate will not run with the disk system. Upgrading to 32K is strongly advised when using disks. You may not feel the need for this much RAM initially, but as you gain programming experience and your programs become longer, the need for more memory will definitely arise.

Another disadvantage to the color disk system at present is the fact that you will not be able to use disks and ROM cartridges at the same time. In order to use a ROM PAK you will have to disable the disk system. This may not be much of a problem for long though, because the port is for expansion and all that is needed is for some enterprising company to develop an expansion board that will allow multiple device connections.

Our unit has operated flawlessly since we received it and we are quite pleased with it. The manual is very easy to follow and explains everything from setup to actual use in very elementary terms. Do be careful when hooking the ribbon cable connecting the DOS ROM PAK and the actual disk drive. It is easy to get the connector mounted upside-down because the illustration describing this connection is not quite clear.

The price of one disk drive, cable and DOS ROMPAK cartridge is \$599. The second, third and fourth drives sell for \$399. each. The overall cost for a two-drive system is about the same as for a two-drive Model I system.

The Color Computer disk system is one of the best values available for high-speed, mass-storage devices. If you decide to upgrade to disk, most assuredly you will never want to go back to a cassette-based system. ■

LEND US YOUR EARS FOR OUR NEW MODEL I AND MODEL III PROGRAM PACKAGES

Basics and Beyond presents Microcosm III—a 20 program package with sound. Includes "Siege", a medieval clash of arms; "Computer Organ" to serenade you; "Long Division" that gently buzzes support of your step by step learning; "Pinball" that bongs and beeps from flipper to spinner; "Submarine" exploding with underwater excitement; and fifteen others. All 20 programs will echo in your home for just \$29.95.

Microcosm I and II, each \$24.95, prove that Basics and Beyond produces high quality, bug-free, challenging program packages for the TRS-80® microcomputers. Creative Computing declared Microcosm I "a worthwhile purchase"; 80-US agreed, calling it "exceptional". Now let us show you our new dimension. It's a sound investment.

Editor/Assembler 1.2 for three

EDTASM improved for Model I and revised for Model III

Model III

The Model I Editor Assembler (26-2002) can be revised to operate on the Model III and improved for the Model I.

When I loaded and ran the Editor Assembler the first time on my Model III, I really wasn't expecting the sign on message I received. The screen displayed a message that only Charlie Chan could have deciphered. The new Tandy Triple obviously spoke in another tongue.

Before I sold my Model I, I had heard the rumors that many of Tandy's programs would not run on the Model III. Here was the proof. I pretended that I understood the note at the top of the screen and issued an EDTASM command. In a moment, a message appeared with which I was familiar. "Cass?"

I had just finished repairing T-BUG for the Model III and knew the cassette routines within EDTASM would also have to be revised. I had failed to realize that in this case, the keyboard and video driver routines would have to be changed as well.

The alterations that I made in the Editor Assembler allow it to operate on the Model III. Source tapes can be written or read at both baud rates. Thus, alterations in programs written originally for the Model I can be made. Object tapes may also be written at either speed.

The first 500 bytes of the original program are eliminated by calling on ROM routines. This allows the program stack to be relocated out of the Model III's buffer. Owners of both models will be able to use lower case text, assuming the necessary hardware modifications have been made to the Model I. Memory size set on power up is honored. This change

was important to me because I have a selectric driver residing at the top of RAM. You may wish to preserve a lower case driver or KBFIX on the Model I.

Other than having the Editor Assembler itself, you must also have a utility program such as Three Bug that can be relocated above 5CFF hex.

The first step then is to load the monitor routine, move it to 5CFFH or higher, and run it. On the Model III, set memory location 4211H to 00H to select the low cassette speed and using the monitors Load command, Load EDTASM.

The following changes are made in the original Editor Assembler program. When more than one value follows an address, the values are entered in subsequent addresses. The Editor Assembler keyboard, video and printer drivers are replaced by ROM routines in this step. Enter:

M 4606 15 40

M 460B 1D 40

M 4610 25 40

M 4615 74 06

That last change at 4615H loads the address of the Model III General I/O driver. For the Model I, the values entered should be C2 03.

The original Editor Assembler masks out lower case letters. You may remove this block simply by entering:

M 4649 00 00 00 00

An unnecessary RAM check is

Kent G. Rothrock, Naperville, IL

performed between 4693H and 46A1H, overwriting high memory. To preserve the memory size set on power up, insert this new code.

M 4693 2A B1 40

M 4696 22 13 41

This next step is for the Model III. The inverse video question mark replaces the cursor symbol. Model I users must enter zeros here.

M 4699 21 23 40

M 469C 36 FC

M 469E 23 36 01 00

To relocate the stack to the area vacated by the Editor Assembler drivers, load 44H into these three locations: 46B2, 46DC, 529C.

Another change for the Model III owner sets the maximum characters to be printed per line and initializes the count to zero. A different value may be entered at 46BE. The 44H shown will result in a maximum length of 70 characters per line. Once again, you Model I types must enter zeros or use this area for your own initialization code.

M 46BA 21 2B 40

M 46BD 36 44

M 46BF 32 2A 40

The next set of changes replaces the cassette routines within the Editor Assembler with calls to the Model III ROM. Model I owners can use this as a guide in locating and replacing similar calls in their

Software innovation

machine. The major differences are that the ROM routines in the Model III that read and write the leader and sync byte, also turn on the recorder motor. The blinking asterisks, appearing as a program is loaded, are a part of the CSIN routine in the Model III and therefore no special call is made for this function in this revision.

The routines that are being replaced are located between 4318H and 43CDH. The changes printed in Table 1 are for the Model III computer only. The call to 0243H reads the header and sync byte. Calling 0287H writes the same items. Calls to 0235H and 024DH read and write a byte of data while 30C0H turns off the cassette motor. The change made at address 4DA6H through 4DA8 was originally a call to blink the asterisk.

The revised Editor Assembler will be saved and loaded at the high baud rate. Therefore, EDTASM will be initialized to produce high speed source code tapes. The code in Table 1 starting with address 4728 allows the Model III owner to change the cassette baud rate while in EDTASM command mode. Press the C key and answer the Cass? prompt with H or L. Before assembling and writing the object code to tape, select the low baud rate.

A final change that can be made is reserved for those with lower case capabilities. That initial sign on message really surprised me and I felt a need for revenge. The area within the Editor Assembler containing its messages starts at 476AH. If your monitor has a Dump command, you can see this text. The last character in each message has the most significant bit in its normal ASCII code set. For example, an R has the ASCII hex value of 52. This becomes F2 when the most significant bit is set. If you decide to alter any of the text in this area, you must follow the same procedure. I changed three messages. The sign on now says, "Model III Assembler Ver. 3.2". The following prompts appear at appropriate times: "CTR-80A Ready?" and "Ready Printer". The addresses and contents to allow these alterations are presented in Table 2.

Once you have completed making these changes, you can punch out a new copy. Model III users enter M 4211 01 to select the high baud rate, prepare the recorder and command:

P 45E6 5CFF 468A EDTASM

The corresponding entry for the Model I without the cassette revisions is:

P 4318 5CEF 468A EDTASM

Captain 80

© 1982, Bob Liddil

Here's the Software Secret Agent, trenchcoat aback, mirror shades reflecting the California sunshine beneath the brim of a battered Sam Spade hat. Investigative reporting is the name of the game and uncovering information is the wave to my surfboard.

I am a movie buff, a cinemaphile, if you will. I saw Time Bandits in England where it was filmed and watched Midnight Man (an old Burt Lancaster movie) *being* filmed. I have seen computers represented in the cinema in every form conceivable, from the wimpish and slightly psychotic HAL in "2001, A Space Odyssey", to the overzealous, intent on becoming human, cyber-entity in "Demon Seed". But, never have I seen anything to compare to a new film called "Evilspeak".

Picture this: A chubby, socially unacceptable youth is enrolled in a military academy where he is mercilessly hazed by resident neanderthals. He introverts and discovers the school computer (simultaneous to discovering a cellar full of Latin-based black mass bibles).

Enterprising lad that he is, he cranks up a Latin translating database on his newly acquired 48K single disk drive Apple II, renders to English the contents of one of the volumes, and types in a new program to *summon the Devil!!!* And he *does it!!!* You can bet that the manufacturers of our humble TRS-80s don't have a program that'll do that. Anyway, the CRT's pulsating energy and pentagrams and (if you'll pardon the pun), all hell's breaking loose. Our boy has superhuman powers bestowed upon him by the necromancing CPU, allowing him to wreak total havok

over his enemies, not to mention raising the stock of studio blood producers by a full eight points on the market.

This blatant misrepresentation of the capabilities of a home computer is an incredible scandal, but there is a bright side. The Apple survived the three thousand degree fire that climaxed the film. I wonder if it is the same one that Apple has been using in their ads lately. The cat looks familiar. I wonder if that Latin-to-English database is translatable to the Model III. Hmmmmmmmmm...

This California sunshine is terrific. We took the Secret agentmobile south to San Diego, to a little shop called Dimensional Software in an outskirts mall.

Dimensional Software is one of the many TRS-80 software/hardware shopping center locations I've visited this year. The interior is clean, well organized into departments, and well stocked with all manner of software from games to business. Two doors from a Radio Shack company store, they exist symbiotically, even though Dimensional Software sells a nationally advertised retrofitted double disk drive TRS-80 Model III.

I found the staff to be knowledgeable, courteous, soft spoken and eager to please. It was refreshing to find a non-Radio Shack computer center that respects the TRS-80 as a factor in the marketplace.

If you're in the Los Angeles or San Diego area, give these guys a try. They've got a dynamite gig going.

Here's the Software Secret Agent, boarding a DC-10 for the return trip to Boston airport. It's ten below zero in New Hampshire, that's twenty

degrees too cold for my boot-phone to work outdoors. Oh well, summer's coming.

• • •

She's long, lean and sleek, built for speed and high maneuverability in atmosphere. She carries five, rapid-fire L-230 medium range laser cannons fitted for short burst high energy saturation power. She's a combat pilot's dream come true.

Who is this lovely lady who's stolen the heart of a dyed-in-the-wool Software Secret Agent? She's the planetary fighter ship from Adventure International's new arcade game called Eliminator.

Ordinarily I don't get all that excited about arcade look-alikes. But from the moment Eliminator arrived, I was impressed with its demeanor. Even the exterior packaging is a cut above the norm. The nameless artist who labors endlessly to enhance the front covers of Scott's software has absolutely outdone himself with this one.

The program is a pleasant surprise. The graphics are vastly superior to any currently available offering in this genre. The screen display is very nearly three dimensional and the execution is so flawless that it is difficult to believe that there's not a film running inside the CPU.

The components of the game are basically similar to that of the popular arcade game Defender. There are towers on the ground which move in perspective. The stars in the background add depth of field. The realistically-depicted fighter is bi-directional. Motion is controlled by the arrow keys, and a radical change in horizontal motion produces a Newtonian skidding

motion that can be fatal if miscalculated.

The creepy critters that materialize to battle with the Eliminator are typical space invaders, dixie cups with eyes and lasers, quick-witted and flawlessly deadly. They form from matter pools and attack the player's ship with a ferocity I've not experienced since the shark in Terror at Salachi Bay got heartburn trying to turn me into a cabin cruiser sandwich.

All in all, Eliminator is a winner. Despite its obvious difficulty, Dickie, resident arcadeophile, dispatched the Adventure International high score that comes with the game within six hours of play. Judging from the noises of excitement he and his sidekick, John, were making, this one should be a natural for the peanutbutter and laserpistol crowd. As for myself, I enjoyed playing it. The game entertained me while giving me ideas on how to equip a new Secret Agentmobile. I recommend Eliminator wholeheartedly. It is slick, professional, and, without qualification, a blast.

Sky Warrior, also by Adventure International, shares the talents of the invisible artist. The artwork is stunning. But there, the similarities between it and Eliminator end. Also commercial arcade based, Sky Warrior is a haphazard and amateurish pale imitation of the original. For a company to release an alpha-character-based spaceship shooting little arrows on the heels of a beam-shooting slick silhouette of a sharp fighter is inexcusable.

Taken on its own merit, Sky Warrior holds up. The scenario of moving through the jagged overhanging cliffs, bombarding anti-aircraft bases, does work. It's not too hard to squeeze a good time out of the game as a whole. But the graphics are reminiscent of a Softside type-in, stick-man pop-dot flicker-arrow-go-boom that would have been state of the art at the time of Instant Software's Doodles and Displays package.

Sky Warrior has speed and the reputation of its quarter-a-game counterpart going for it, but let's face reality. The software buying public has played Robot Attack with graphic men and Scarfman with

very realistic ghosties. They've played a blue million versions of Space Invaders with as many different creepy crawlies as munchers, and Duel-in-Droids with honest-to-goodness swordfighting Andys. Are they going to pay a premium price for synchronously moving diagonal dots, a spaceship that would have Doctor Smith turning up his nose on a free ride back to Earth, and Harry Mudd giving up grifting?

Yes, very likely—if for no other reason than despite its visual inequities, Sky Warrior is not a ripoff. It's not a boring game, or an easy game, a slow, or even a *bad* game. It's just an *unprofessional* game. That, in and of itself, is not a fatal flaw. Tell you what . . . if you disagree, write me and tell me. I'm not infallible by any stretch of the imagination.

It is not like the early days of software production anymore. Back then (in the Doodles and Displays years), a small producer could put together a Lunar Lander or a Wumpus, get a neighborhood artist to paste a clip art spaceship or (whatever a Wumpus is) on a Xerox sheet, stuff it into a ziplock, buy an inexpensive ad in a small magazine and sell a couple of hundred copies for munchie money. The big guys changed that.

Now, there are a handful of distributors who hold the key to hundreds of small stores who seldom buy from unrepresented independents. And, there are a handful of Big Gun Software companies, the Software Superpowers (like Instant Software and Adventure) who've sunk megabucks into multi-colored ad campaigns and expensive, versit-talented staffers whose jobs are to merchandise to the masses. There's nothing wrong with that. But with that national reputation comes a public trust, a duty, if you will, to be true to the customer.

Underneath the highly polished ultra-slick packaging, beyond the clever wording of the advertising, had better be a solid, top-quality program. After all, \$19.95 is too much to pay for a five by seven, five-color piece of artwork with writing on it—even if it IS a limited edition. ■

FOR TRS-80 MODEL I OR III AND SOON FOR THE NEW IBM PERSONAL COMPUTER!

- ★ **MORE SPEED**
10-20 times faster than Level II BASIC.
- ★ **MORE ROOM**
Very compact compiled code plus VIRTUAL MEMORY makes your RAM act larger. Variable number of block buffers. 31-char.-unique word-names use only 4 bytes in header!
- ★ **MORE INSTRUCTIONS**
Add YOUR commands to its 79-STANDARD-plus instruction set!
Far more complete than most Forths: single & double precision, arrays, string-handling, clock, more.
- ★ **MORE EASE**
Excellent full-screen Editor, structured & modular programming
Word search utility
THE NOTEPAD letter writer
Optimized for your TRS-80 or IBM with keyboard repeats, upper/lower case display driver, full ASCII, single & double-width graphics, etc.
- ★ **MORE POWER**
Forth operating system
Interpreter AND compiler
8080 or 8088 Assembler
(Z80 Assembler also available for TRS-80)
Intermix 35- to 80-track disk drives
Model III and IBM can read, write and run each other's and Model I diskettes!
VIRTUAL I/O for video and printer, disk and tape (10-Megabyte hard disk available)

MX-80 mods for Model I

... without an expansion interface

Model I and MX-80

Robert L. Green, Atlanta, GA

If you have a Model I with no expansion interface, but want to use the Epson MX-80 printer, this simple modification is for you.

I purchased the MX-80 for the Admissions Office of Dekalb Area Technical School to replace an old RO-33 teletype, but the MX-80 would not handshake through the Radio Shack Printer Interface (cat. no. 1411). I paid hundreds of dollars for a paper weight? A call to Jade (where I bought it) resulted in an engineer telling me he'd never seen it done, but someone had soldered a jumper to make it all work. A local Apple/Epson dealer said it could not be done. A Radio Shack Computer Center said it was not possible . . . so, I had to do it!

Put a towel on a flat surface and lay the printer face down (after disconnecting wire rack, cable, etc.). Use a phillips screwdriver to unscrew the corner screws, but leave them in their respective wells. Tape the holes (to hold the screws). Turn the printer back over and pull off the black plastic roller knob. Carefully pull the printer top up and to the right, being sure to clear the protruding roller stud. If resistance

is felt, note the colored wires at the base. Push them down and forward (to you) to release them and slide the printer case top off—not pulling off the wires in the process. Stand the top on its side and slide the back corner of it under the printer base for support. The owner's manual should have covered all of this, before, to let you check out the two blocks of dip switches. (See Diagram A.)

Use a phillips screwdriver to remove the two screws holding down the small 3"x5" printed circuit (PC) board at the left rear. Cut a 3/2 inch, small diameter, insulated wire. Bare both ends and coat them with solder. Use a small common screwdriver to carefully pry up the two rectangular black pin connector boxes between the PC boards. Lift up the small PC board to expose the shiny, flat input pins at the rear.

Bend one end of your jumper into a hook and hook it onto the farthest right shiny, flat, input pin connector (Diagram A again). Solder it. Note Diagram B. Solder the free jumper end to the bump of solder found above the lettering: 74LS3673B. The bump is above the main CPU (Diagram B).

Careful folks may wish to test the

unit by hooking up the cables, paper, etc., before reassembly, but I did not. Replace the small PC board and carefully push the black pin connector boxes together and screw in the two screws.

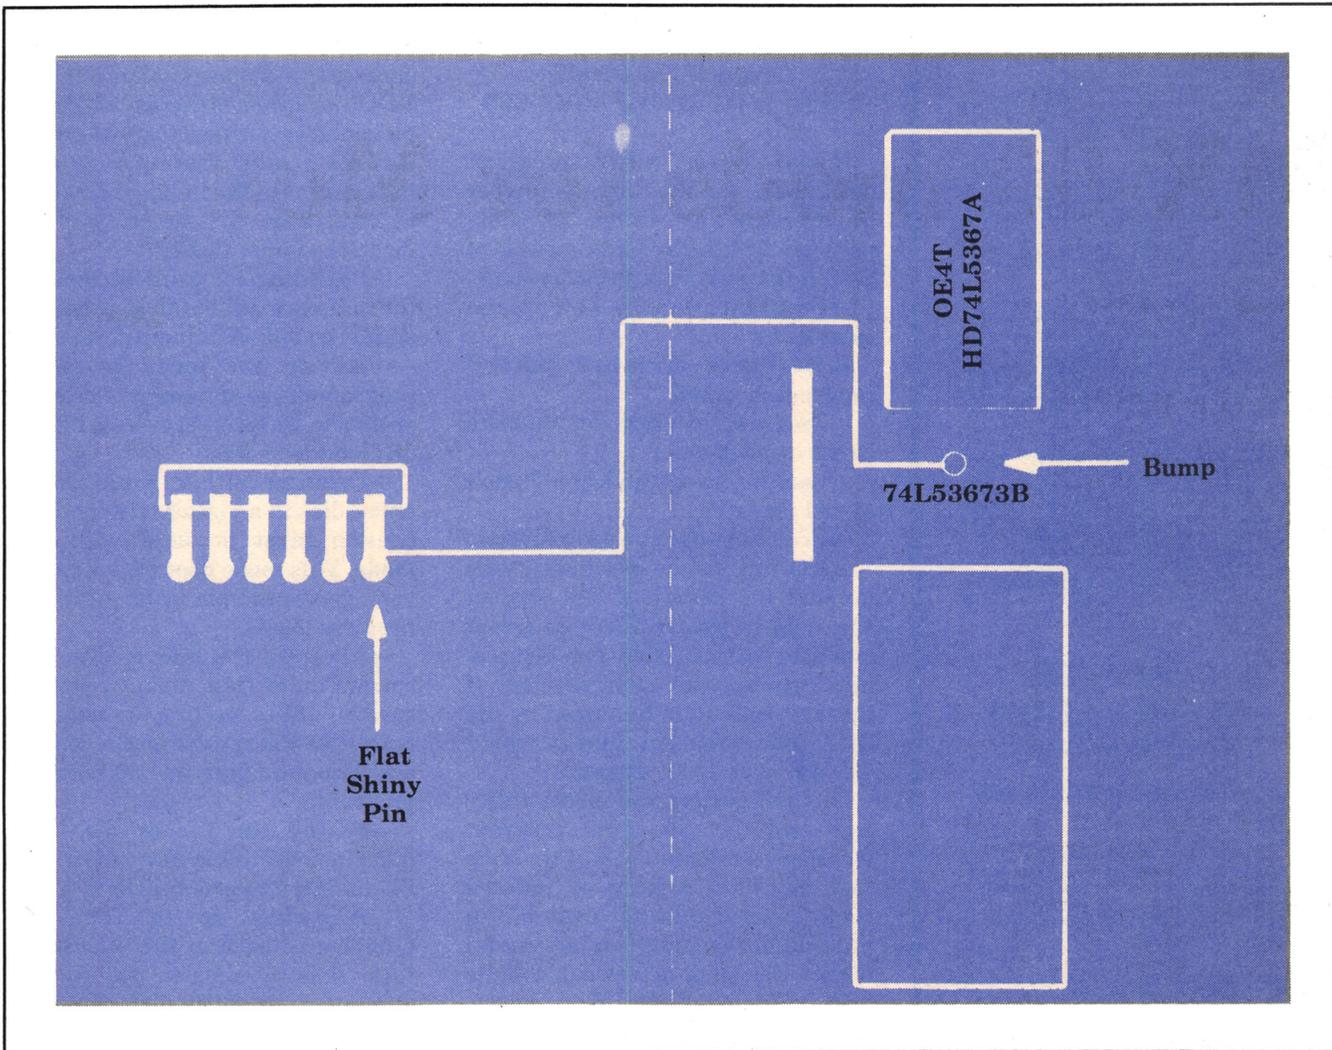

Option

Epson published a consumer bulletin for printers that encountered registration difficulties. You may want to take your printer in for the free modification (before you use mine) or do it yourself. A local dealer let me exchange the CPU for the three EPROMs kit. I popped out the CPU, following Epson's printed directions, then pushed in the three EPROMs and cut the jumper marked (J1) to the right of the CPU.

Slip the cover back on (watching to get the metal roller rod into the side hole). Replace the roller knob. Turn the unit over, remove the tape on the corners, and screw back the screws. Flip the unit back over and attach the cable and interface with the blue-coded wire to the left of the operator (coming from CPU, black box, and going into the rear of the printer). You now have a fully functioning printer at substantial savings of both dollars and time.

Diagram B

Circle # 48

OMNITERM

What is OMNITERM?

OMNITERM is a professional communications package for the TRS-80 that allows you to easily communicate and transfer files or programs with almost any other computer. We've never found a computer that OMNITERM can't work with. It's a complete package because it includes not only the terminal program itself, but also conversion utilities, a text editor, special configuration files, serious documentation and serious support.

Why do I need it?

You need OMNITERM if you need to communicate efficiently with many different computers, or if you want to customize your TRS-80 for use with one particular computer. You need OMNITERM to SOLVE your communications problems once and for all.

What do I get?

The OMNITERM package includes the OMNITERM terminal program, four conversion utilities, a text editor, and setting files for use with popular computers such as CompuServe, the Source, and Dow Jones — just as samples of what you can

The ULTIMATE TRS-80 Terminal Package

do for the computer you want to work with. The package includes six programs, seven data files, and real documentation: a 76-page manual that has been called "the best in the industry." And OMNITERM comes with real user support. We can be reached via CompuServe, Source, phone, or mail to promptly answer your questions about using OMNITERM.

What do I need to use OMNITERM?

A Model I or Model III TRS-80, at least 32K of memory, one disk, and the RS-232 interface, or Microconnection modem. OMNITERM works with all ROMs and DOSes, and will work with your special keyboard drivers.

What will it do?

OMNITERM allows you to translate any character going to any device: printer, screen, disk, keyboard, or communications line, giving you complete control and allowing you to redefine the character sets of all devices. It will let you transfer data, and run your printer while connected for a record of everything that happens. OMNITERM can reformat your screen so that 80, 32, or 40 column lines are easy to read and look neat on your TRS-80 screen. It even lets you get on remote computers with just one keystroke! The program lets you send special characters, echo characters, count UART errors, configure your UART, send True Breaks and use lower case. It accepts VIDEOTEX codes, giving you full cursor control. It will even let you review text that has scrolled off the screen! Best of all, OMNITERM will save a special file with all your changes so you

can quickly use OMNITERM for any one of many different computers by loading the proper file. It's easy to use since it's menu driven, and gives you a full status display so you can examine and change everything.

"OMNITERM has my vote as the top TRS-80 terminal program available today" Kilobaud Microcomputing, June 1981, pages 16-19.

OMNITERM is \$95 (plus shipping if COD) Call for 24 hour shipment. Manual alone \$15, applied toward complete package. Visa, M/C, and COD accepted. MA residents add 5% tax. Dealer inquiries invited.

Contact Lindbergh Systems for your custom programming needs. We are expert at writing software to work with YOUR hardware, in assembler, high-level language, or FortH.

Lindbergh Systems

LOW-LEVEL CENTER

TRS-80 Model I/III

STRETCH SUPERSTEP: New third generation Z80 simulator is the leading element of the Software CPU design base. Animated Z80 Programming Models, Intelligent RAM Window, scrolling disassembler are now extended. New modules are FLTCUR 2-D byte oriented editor with full floating cursor and auto-repeat plus innovative BUFSTF user-defined buffer/window setup for flexible skeleton program views. Use BUFSTF to view large amounts of disassembled code, isolate all instances of selected instructions in several formats, more. Gather instruction frequency counts in straight-line or program-flow order for sophisticated analysis of subject programs and Z80 resource use. Many formatted transparent printer options, including screen pix and instruction-by-instruction tabular listing of all active machine aspects. Pictorial manual gives easy intro to program operation. Nothing newer for byte-entry, debugging and analysis of Z80 machine language programs. \$39.95 + \$2.00 shipping

EMU 02e: Detailed instruction-level 6502 simulator with animated before/after 6502 Programming Models (registers, flags and stack) and scrolling instruction stream disassembler active in Single-step and 4-speed TRACE modes, also special high speed interpreter running over 5% actual 1 mhz 6502 processor speed. Have a 6502 without having a 6502, find out why the 6502 brain was picked by Apple, PET, Atari, arcade machines, etc. \$29.95 + \$2.00 shipping

BALCODE 80A: Highly interesting mid-level language for TRS-80 Model I. IBM's BAL (Basic Assembler Language) is an idealized machine instruction set currently in use on the IBM 360/370. BALCODE 80A implements an extended BAL subset via a text editor and macro assembler; you write in BAL with 20 p-registers (16 general purpose, 4 floating point) and powerful addressing modes, then assemble to fast Z80 code. Hands on introduction to BAL, source programs are highly portable to make your TRS-80 an IBM workalike! Includes 106 page IBM reference publication describing BAL. From Balcode Software. \$79.00 + \$3.00 shipping

COMPILER WORKSTATION

TRS-80 Model I and III

Your BASIC program development could go faster...

EDIT: Full-Screen BASIC editor with floating cursor and auto-repeat. More than 30 commands and functions let you variously find, change, insert, delete, replace, replicate, copy, move or position BASIC text at the character, string, line or block level. Developed in Britain by Southern Software. Mod I, III \$40.00 + 1.50 shipping.

PACKER: (Cottage Software) Editing tool will unpack, shorten, repack, renumber all or part of your BASIC text. The UNPACK segment is very useful when preparing BASIC source programs for compilation by ACCEL2. Mod I, III \$29.95 + 1.00 shipping.

Then your BASIC program could go faster...

ACCEL2: Compiler for TRS-80 Mod I, Mod III Disk BASIC. New functional improvements in place to give more ease-of-use, quicker compilation of large programs, better chaining of compiled and non-compiled programs. Size read-out helps you monitor code growth during compilation. REM NOARRAY option lets you use variable-bound arrays. Professionals note: Comprehensive instructions show how to organize your compiled programs for resale on tape, ES/F water or disk. No royalties! Developed in Britain by Southern Software. Specify Mod I or III. \$88.95 + \$2.00 shipping.

TSAVE: Writes compiler output to independent SYSTEM tape. \$9.95 + \$1.00 shipping.

EXEC: Command-List Processor for TRS-80 Mod I. Prepare, execute, pass as many as nine parameters to lists of TRSDOS or NEWDOS commands and/or BASIC statements. Simplifies repetitive procedures such as power-up sequences, file setups, etc. Compatible with ACCEL2 compiler disk output. Developed in Britain by Southern Software. \$22.00 + \$1.00 shipping.

Discat

Racet Companies

1330 N. Glassell Suite M

Orange, CA 92667

Model I/III 32K or 48K—\$50

Discat is a utility program designed to aid the computer owner in creating an index of disk-program location records capable of giving the following information:

- Program names and name extensions

- Diskette number where program is stored

- Program location on diskette (front or back side)

- Length (in granules) of each stored program

- Free disk space on each diskette

According to the excellent user's manual for Discat, a 32K system can hold in excess of 800 program location records. There can be up to nine indexes in each catalog of indexes, individually named by the user. The program library could contain over 7200 programs.

In a 48K system, the Discat utility can provide over 1900 program location records in each of the nine indexes. This catalog of indexes could contain data for over 17,000 programs, depending on how many tracks your disk drives can handle and your available disk space. Seventeen thousand program location records could fill over five diskettes with data.

Placing all of the 800 (or 1900) program records in an index in memory at the same time allows extremely fast access to the location of a particular program on disk.

Discat is written in machine code and, according to the user's manual, is capable of:

- Loading an index file containing over 800 records into memory in *less than 15 seconds* (1900 in less than 25 seconds).

- Searching for the location of a specific program in less than three seconds (for an 800 entry file).

- Automatically keeping track of free space available for each of your diskettes.

- Changing the active drive from zero through three for use by systems with more than one disk drive when in the automatic directory update mode.

- Allowing manual program/disk number entries for those special cases such as foreign operating systems (similar to CPM, VDOS or other diskettes without a normal directory system) where the diskette number and contents need to be added to the index and cannot be read from the directory of the diskette automatically.

- Providing for printed copies of the indexes in the catalog, either in a single- or double-column format.

- Sorting the index by either program name or number. Sorts 800 entries in 25 seconds or less, 1900 in 65 seconds or less.

- Deleting either program or entire disk in a matter of seconds, so caution must be used with this mode. This mode does provide some very good prompts to help prevent needless losses.

- Allowing the user to clear the current index from memory using a special utility section in order to start a new index without rebooting and also providing an exit from the program.

- Saving the file to the same index or selecting a new index after file maintenance is finished.

- Allowing up to 100 disk numbers in each of the nine index files. It is possible to use up to a maximum of 9999 different disk numbers. By making up different indexes on other disks it is possible to build a library of programs on numbered disks that could be arranged in ten 1000-diskette catalogs.

Discat is completely menu driven and is therefore easy for anyone to use. It also gives plenty of warnings where errors could be costly.

This review is not intended to describe all that Discat can do, but to give the reader some insight into its potential. At the time we started using it, we had over 1500 programs and had made no attempt to organize them by subject. It took approximately two hours to catalog and the speed at which it finds any given program is fantastic. We chose to make one index of our master's (original copies) which has been extremely useful.

Our only complaint is not a serious one. One of the other programs we used had the

capability of "comment lines" in the hard copy of the catalog. That is not possible in this program, but its loss is more than compensated for by the capacity, speed and ease of use of Discat.

Although we did not test this program with a large variety of operating systems, we did find it to be compatible with most operating systems, including NEWDOS80. It is *not* compatible with double density at this time.

This program is definitely a "must" for anyone with a varied program library.

John and Nikki Newman

TRS-80 Assembly Language
by Hubert Howe, Jr.
Prentice Hall Books
186 pages, hardbound \$9.95

I cut my teeth on Bill Barden's TRS-80. Assembly Language Programming. It is a painless and simplified tour through the wonderland of Z80 programming for TRS-80 users. It has some deficiencies though, such as no mention of ROM calls, disk I/O, or interfacing BASIC and machine code via the `USR` function. Floating point is mentioned in passing, but not enough to give any decent understanding of the subject. Still, it is a good book.

Hubert Howe's book, TRS-80 Assembly Language Programming, on the other hand, has chapters on all of the above deficiencies. It is clear and very easy reading, although not long enough to be exhaustive.

It starts out, innocuously enough, with a basic introduction to terminology: ROM, RAM, video, binary, hexadecimal, ASCII and number formats. It then goes on to Z80 architecture with an introduction to the registers. One nicety is the explanation of the addressing modes presented in table form; a feature lacking in most other books. Thus, the wayfaring beginner can easily find out which addressing mode is which when he needs to reference a command.

Chapter two and the following one deal with an overview of Z80 instructions. Howe's approach seems a little scattered to my methodical tastes. The approach is taken to avoid panicking the

students.

Chapter four discusses the stack: What a stack is, what it does, and the commands we have for it. This includes not only `PUSH` and `POP`, but also `CALL` and `RET`.

Chapter five has a brief memory map for the TRS-80 and discusses some ROM routines. A nice point about this is that it tells which registers the ROM routines will use. The map is not exhaustive, but it really needn't be. For most assembly language programming, you cannot use many of the ROM routines. Keyboard and video routines are there, and knowing how to use them is helpful. The cassette I/O routines are discussed, as well as some other miscellaneous I/O routines. The entry points for the BASIC reserved words are presented as well.

After this 50-page introduction, which is eminently readable, chapter six begins the programming information. Here we are told how to use the editor/assembler. Radio Shack's manual is not as plain to read as some people would like (although it reads like a Superman comic compared with the AIM 65 editor/assembler instructions). This chapter is an account of how it works, complete with a sample program. It makes sense of the manual and when there is no one else around, it's nice to have a clear reference.

The next chapter talks about getting numbers - binary, hex and decimal - in and out of the computer. Back when I first got into this sort of thing, I was concerned about getting my numbers out. What can I do with this fancy program if I cannot get the answer out of the machine? This section is particularly good as an introduction to the video display of numbers, in both hex and decimal. The routines in this chapter cover input as well as output of numbers.

Next, Howe talks about arrays, tables, and other simple data structures, followed by a discussion of the movement of data. A few methods for storing data in tables are given. The movement of data is straightforward and he discusses searching for specific data in blocks of memory.

Chapter ten, Arithmetic Operations with Integers, includes the two's complement binary representation. This is important, although its utility is more theoretical than practical with the advent of hexadecimal monitors.

If you have
anything to do

**EIGHTY
SYSTEM
NEWSLETTER**
every week!

Don't miss a single issue of the new Eighty System Newsletter... published weekly and mailed every Friday by First Class Mail. This is the only publication designed for personnel in the TRS-80* industry, including manufacturers, distributors, dealers and computer users. The Eighty System Newsletter is compiled and edited by Ken Gordon, producer of the National TRS-80* Show, the Eighty/Apple Show, the NJ Microcomputer Show, and publisher of the Amateur Radio Equipment Directory. Here is valuable information in professionally prepared format about TRS-80* hardware, software, peripherals, trends in the industry, and latest news. In addition, each weekly issue contains brief digests of articles related to the TRS-80* system appearing in over 100 computer related and general interest publications. This bibliography will save you both time and money in keeping up with articles in print on the TRS-80* computer system. The Eighty System Newsletter is a must for all active TRS-80* users, plus anyone involved in any way with the manufacturing, distributing or retailing of TRS-80* products.

Subscribe today: Mail the coupon with your check for \$39 for the next 52 weekly issues (sent First Class Mail that's only 75¢ per week.) If for any reason you are not satisfied with the Eighty System Newsletter — we will refund the undelivered portion of your subscription.

Reviews

The various addition and subtraction commands are noted and discussed in a reasonably complete fashion, including multiple precision arithmetic.

Chapter 11 is on floating point numbers and BCD (Binary Coded Decimal). The chapter is a bit short (pun intended) and talks about the basics. It ought to be longer to really deal with the subjects. The format used for TRS-80 floating point is briefly talked about. More information would be nice, but for a beginner, the discussion is well done. BCD is discussed in greater detail. Rightly so, in my opinion, since it is both easy to implement and understand.

Chapter 13 is devoted to multiplication and division. Routines for both eight and 16 bit multiplication are presented here in such a manner as to make some fairly difficult concepts transparent.

The chapter on cassette I/O is excellent. There is even a routine that reads machine language object tapes, gives the name, starting, ending and transfer addresses, complete with comments. Tape formats are discussed. Also here is a routine that will read and store non-standard tape formats in memory where they may be examined. In my opinion, this chapter is much better than any other I have seen on the subject.

The chapter on USB routines is fairly good. It discusses a variety of concerns for the USB-user; such as accessing the routine, returning from the routine, and passing values back and forth. Hybrid programs that sort numbers and strings are presented.

The place where the book shines is the chapter on disk I/O. Few books on assembly language programming even mention the subject. Little known topics such as choosing the drive and writing and reading bytes are discussed. Topics such as reading a sector or track are included and all routines include comments. Excellent!

The last chapter deals with disk files. The directory is discussed along with the different types of file formats. Although much of this information appears in other books, it is nice to have here. The FPDE (File Primary Directory Entries) are mentioned and decoded, and the information is presented in an easy-to-read table. Information on GAT and HIT sectors, passwords, and the math formula used to get the 2-byte HASH codes are all there. This

chapter is the best part of the book.

Howe's book is an excellent place to start for someone wishing to learn more about his or her TRS-80. It is not *the* book on assembly language, but is well worth the price.

Bruce P Douglass

Planetoids

TRS-80 Model I/III

16K tape \$19.95

32K disk \$20.95

Adventure International

Box 3435

Longwood, FL 32750

(800) 327-7172

Planetoids, written by Greg Hassett and marketed by Adventure International, is a high speed, multi-option version of Asteroids. In its basic form, it offers the arcade player the same challenge as does the original Atari arcade version, minus the sound effects and the excellent high resolution graphics. Then again, an Asteroids game machine costs \$5000 and eats quarters all day. The graphics in Planetoids are excellent and the lack of sound effects may actually be less distracting to some players.

Placed in the center of an infinite field of asteroids, you must use your ship's laser cannon to destroy as many of the asteroids as you can, avoiding collisions with the obstacles. As you blast the gigantic rocks, the impact of the laser splits them into smaller fragments. Your score depends not only on the number, but also the size of the asteroids that you annihilate. The smaller targets are worth more points than the larger ones.

To make it more interesting, alien spaceships attempt to eliminate you. You can rotate your ship into 12 different positions, use your thrusters, fire your cannon, or attempt hyperspace escape. Hyperspace is used as a last ditch effort to escape enemy fire or collision with an asteroid. You may find that hyperspace relocates your ship in a worse location than where you were (on an asteroid or enemy ship).

There are five different types of enemy spaceships that attack your ship. Most are fairly easy to destroy, the exception being the dreaded Zoron Battle Star. This one fires

multiple, high-speed missiles very accurately. Your only hope is to blast him before he gets a salvo off. This ship is also the only one that is not destroyed by collision with the asteroids. As your score increases, so does the frequency of the appearance of the enemy ships, the number of missiles fired by the alien ships, and the number of asteroids. It becomes increasingly challenging as your points mount. Scores of over 100,000 are uncommon.

What sets this version apart from the rest is that there are eight options that can be activated during the game. The first option freezes the action indefinitely so that you can rest your fingers, answer the telephone, or tend to other trivial matters. Practice mode allows you to play at the higher difficulty levels offered by high scores.

You can abort the game at any time by pressing "2" and no one will ever know. You can save and load the top ten high scores to tape with options "3" and "4". There is a high speed option available that doubles the speed of the asteroids. "Cruze" mode slows the asteroids down to almost a stop, allowing you to practice using the thrusters. "Dogfight" eliminates the asteroids completely so that you can fight the alien ships without worrying about hitting the asteroids. You may also combine dogfight with the practice mode, giving you a real challenge.

This game is probably the all-time favorite around our house. It has all of the features that make for many hours of entertainment. The top ten scores are posted after every game, giving the holders a reward for their skill and bravery. It does not become as time worn as some of the other games available for the TRS-80 and the multitude of extra features give it an edge over competing versions.

Invasion Orion
Automated Simulations
P.O. Box 4247
1988 Leghorn Street
Mt. View, CA 94040
1-800-824-7888

\$24.95 cassette or disk plus
\$2.00 s/h Model I/III Level II
 Some programs achieve instant notoriety. Others, equally good,

don't receive half the attention they deserve. One such program is Invasion Orion, by Automated Simulations. Although it's been out for two years, it's only recently been getting the advertising space that its qualities merit.

Invasion Orion is the solitaire version of Starfleet Orion, a game in which two players maneuvered various types of starships in combat against one another. In Invasion Orion, the computer itself becomes your opponent. While it is by no means as capable as a human opponent, the resulting games are always an interesting challenge. The newest versions of Invasion Orion also allow you to play against a human opponent.

Invasion Orion is available either as a 16K tape, or as 32K disk. Invasion Orion now comes in a box which contains the program tape or disk, and an instruction booklet that's a wonder to behold. The instruction booklet (i.e., the "Battle Manual") practically deserves a review all by itself. Obviously prepared with great care, the operating instructions are clear and explicit. The Battle Manual explains the historical background against which the various scenarios are played.

Briefly, Invasion Orion recounts the struggle of the human Orion colonists against the alien Klaatu invaders. Each scenario consists of a short story that sets up the action, the characters involved, the type of ships on each side, and the positions of the ships and planets in space. All of the variables relating to the ships and planets are changeable—i.e., you can create new scenarios at will. All of the short stories are well written; no mean feat in itself.

As an added bonus, the Battle Manual also contains design notes, notes on tactics, a discussion of the decision, models used by the computer, and a short survey of the specific algorithms involved. Older versions of the game also included complete listings of the programs. All in all, an insightful mix of material that I've read with fascination several times.

The program tape consists of three parts. Side One contains two programs. The first is the Game program, which is used to play the

PROOF READER
 The Aspen Software Company Spelling Checker.
 +
GRAMMATIK
 Beyond Spelling Checking

**THE ONLY COMPLETE
 PROOFREADING PACKAGE**

**FOR ALL CP/M, MS-DOS,
 AND TRS-80 WORD PROCESSORS**

We'll match Proofreader with any other spelling checker on the market. It has a big 38,000 word expandable dictionary, and can check even your largest documents in under four minutes. Proofreader looks up every word, and does not use less accurate root word analysis like some others. Full interactive correction is standard on CP/M and TRS-80 Model II systems, and is a low cost option for the TRS-80 Model I/III.

Spelling checking alone is not enough! No one else has anything like Grammatik! It analyzes your document for common typos, punctuation errors, misused phrases, and poor writing style. Grammatik is receiving rave reviews from both critics and users. Bob Loudon in InfoWorld (12/7/81): "Grammatik is a surprisingly fast and easy tool for analyzing writing style and punctuation. If you are currently doing original writing on a word processor, you should consider this product." Eric Balkan in The Computer Consultant: "I'm impressed with the imagination that went into this product." A user: "Thanks for making my life easier!"

Grammatik and Proofreader are compatible with all CP/M, MS-DOS (including IBM PC), and TRS-80 word processors.

Current CP/M formats:

standard 8", NorthStar, Omikron TRS-80.

Please call or write for details of minimum system sizes, and availability of additional disk and operating system formats. Shipping costs included.

Please specify your system configuration when ordering. Dealer inquiries invited.

 (505) 281-1634

various scenarios. The second is the Builder program which is used to create the scenarios and save them. Side Two of the tape contains the data for the first two scenarios.

If you want to play the remaining eight scenarios in the Battle Manual, you have to first create them with the Builder program and then save them on a separate data tape. This is not difficult, and the saved copy can be used over and over again. The disk version has all ten scenarios already prepared and ready to use.

To play the game, you first load the Game program. Then you position your scenario data tape on the recorder. The Game program will request the name of the scenario to be played, the side you wish to play on, and the desired level of experience—i.e., difficulty. You can direct the forces of the Klaatu if you're feeling particularly heartless, and the computer will command the Orion ships. The computer isn't always very good playing the human side. In some scenarios, it's not practical at all, but the Battle Manual is usually quite explicit about this.

The action takes place on an invisible grid 62 units in width and 34 units in height. There is no depth dimension, except that two or more ships may occupy the same location without colliding. The ships appear as lighted bits. Each is identified by either a letter or a number so you won't get confused and shoot at one of your own ships. There are up to nine ships on each side.

A table at the back of the Battle Manual lists the various types of starships and their characteristics. There are 34 types in all, ranging from fighters to dreadnoughts. The ships differ in many ways, such as drive strength, beam power, number of launch tubes, number of missiles and torpedos, armor thickness, and total energy available. The computer may be queried at any time during the course of the game regarding the current status of any of your ships. It will not reveal the status of its ships until the scenario is completed.

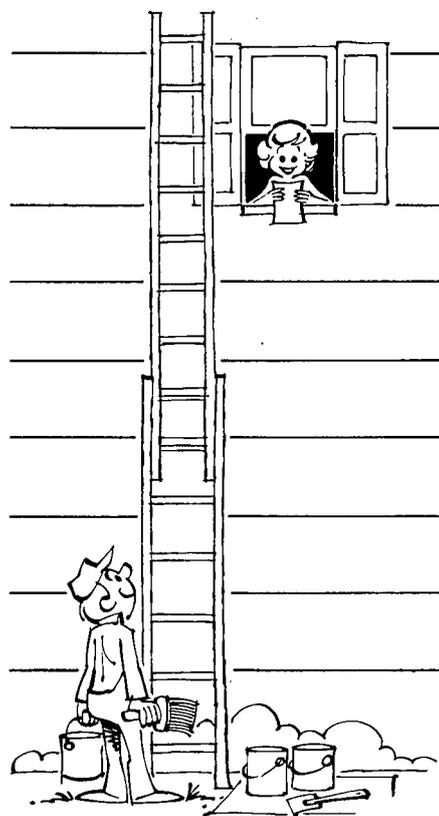

If a ship is hit by a beam, it flickers. Missiles appear on the screen as asterisks; torpedos as blinking bits that move slowly across the screen. If a ship is destroyed, it explodes at the end of the turn in a shower of lighted bits. Several of the scenarios make use of tractor and pressor beams to move ships around.

I have played Invasion Orion for several months now, and I have never found it boring. There are some minor problems. Torpedos launched along the boundary of the playing grid take a great deal of time to move along their trajectory. You can only launch one torpedo at a time, no matter how many launch tubes you have available. Scenario names appear to be limited in length to 15 characters, but there is no mention of this in the Battle Manual. If you create a scenario with a name that is too long, it will not be loaded correctly by the game program, and your entire effort will

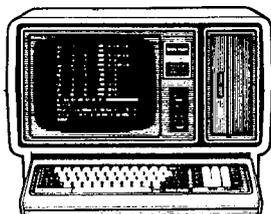

be wasted.

But this is quibbling. Invasion Orion literally lets your imagination run wild. Frustrated science fiction writers take note! If you ever tire of the scenarios given, you can create new ones at any time. This program is a bit more expensive than some, but I feel that the investment is well worth the many hours of enjoyment that it will bring.

Voyage of the Valkyrie
 Model I/III 16K cassette \$34.95
 32K disk \$39.95
 Advanced Operating Systems
 450 St. John Road
 Michigan City, IN 46360
 (800) 348-8558

We had just returned to Castle Sjaelbjerg after defeating the defense forces of both Castle Jammer and Castle Vakker. The battles were decisive and the victories complete, with no quarter asked and none given. I was pleased to have our leader promote me to Sergeant in our small, but proud, air force. As chief gunner and navigator, I was called before the king's own defense advisor and given the latest map of the known world. He told me then that this map had cost the lives of not less than 20 expeditionary groups and that even though there were several copies, none was complete. Somewhere, in one of the other castles, was a map showing the way to at least two more castles beyond the eight which we know and had mapped.

My job was to obtain that information. Success meant promotion, fame, and wealth; defeat would only offer death as its reward. Refueling completed, we lifted off and headed south from our home.

Almost immediately, we were intercepted by a squadron of the infamous Fugloy air force. We were able to kill only one or two of them. We managed to hide above in the clouds before our energy reserves were depleted to the point that our defense shields would have failed. We continued on to our first destination—Castle Torden, each of us wondering if we would be the next crew to disappear in our long search for the mysterious missing lands and their reported riches.

With just a little imagination, Leo Christopherson's latest master-piece, "Voyage of the Valkyrie," can be as adventuresome as any other game currently available to TRS-80 users. The basic object of the game is to find and conquer all 10 castles in the imaginary land of Fugloy. Each castle is defended by a group of ruthless birds whose primary pleasure in life seems to be to deprive you of your own precious life. Before you can do battle you first must find them, and this is the first stage of the game.

The game package on diskette comes with 11 pages of instructions. After reading and digesting the rules of the game, you are ready to begin mapping the land of Fugloy. You are also provided with about 10 maps of the game board you will be playing on. Your starting position is marked, but that is about all that is marked.

The mountains you may run into aren't marked. Neither are any of the fog banks (all the castles are located on islands). It is up to you to determine which paths are safe to fly and which are roads to destruction. Once you have a completed map, you may begin a campaign of conquest, although by this time, you have probably been smashed against seen and unseen mountains, lost at sea, or shot down by the Fugloy air force.

The first thing you notice about this time is that you only have a map of eight enemy castles, not the ten

Reviews

promised by your manual. Despair not, you will have an opportunity to locate the last two once you have captured the first eight. Yes, more mapping expeditions are yet to come. That is the last hint I will give away.

As we have come to expect from 037's past efforts, the animated graphics are superb. The birds of each castle are depicted both flapping their wings to climb for altitude and with wings extended as they soar down toward you. As many as six or eight of them may appear on your display before you kill them all off. Each one will dodge your fire and getting them into the moveable cross-hairs on your weapon system can be a really tough job. That comment leads me to my only real complaint about the game: the fire control and aiming system.

The sights consist of a vertical and horizontal line of dashes that can be controlled separately or as a pair with the buttons of the number pad, or just the number keys if you do not have a number pad. This presents somewhat of a problem in trying to watch the screen and remember where your fingers are. You *must* watch the screen or you will surely be killed. Practice has helped me over this problem. Joysticks would have been nice, but no mention is made of the program supporting any joysticks, and I don't have any to try out (got to get one, just as soon as Someday shows up on my calendar).

Mr. Christopherson is probably best known for his animated graphics used in combination with well developed musical effects. He hasn't neglected the audio aspect of this game at all. There are respectable sound effects during the action portions of the game, and he also gives you the option of having selected classical pieces played during the breaks in the action. The option is given so that those without sound capability would not have to sit and stare at an unmoving screen while some of Richard Wagner's operas are played.

If you hook up your external amplifier speaker and respond "Y" to the question "Sound?", you will be greeted with the March from Tannhauser as you begin a game. "The Ride of the Valkyrie" is played each time you capture a castle. If you are killed during the game, another selection from "The Valkyrie" is played at your funeral. I will let my wife testify to the quality of the musical selections. When I first fired up the game disk and it began playing the march through my Radio Shack telephone listener, she came back to the computer room saying, "I know you don't have an organ back here." I think that speaks well enough for the music. A demonstration at the Midwest City Radio Shack Computer Center brought the comment that it was probably as close to two voices as you could get with the setup.

There are ten levels of difficulty to choose from. The differences lie in the number of birds that will be defending each of the castles. More birds mean more trips between your home base for refueling before any given castle can be defeated. This results in a longer game and a greater possibility that you will run out of power during a battle, or out of fuel when trying to return to base. Either condition is, of course, fatal.

During play, the only "fault" that I noticed was that my rate of fire decreased as the number of attacking birds increased. This is not really noticed until you are

Reviews

under attack by four or more birds and does not detract much, if any, from the game.

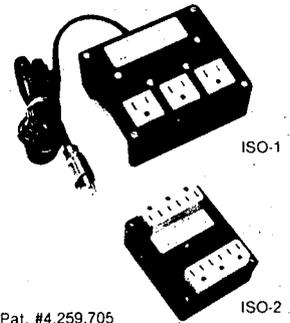

The packaging is nice. The diskette has booted without problem each time (although I am using a backup created with Super Utility Plus). The instruction manual is of good quality and the instructions cover the theme, objectives, and rules of the game completely. The disk is usable on both the Model I and the Model III computers. Model III users must first CONVERT the diskette files to a TRSDOS 2.2 diskette. Instructions for this are in the manual as are instructions for those who purchased the cassette version.

I would recommend this game as a MUST to have in any library. It requires the player to have the strategy planning ability of Risk, the digital dexterity of a piano virtuoso, and the patience of the sphinx. The rewards are hours of challenge, frustration, and a full color poster from the distributors when you find all ten castles. This is not a game you will master at one or two sittings—and those sittings will probably be hours long. It is addictive . . . and GREAT.

**Can You Create Letters Like The Above
In 4 Keystrokes . . .**

And Have A Word Processor Print Them Just As A Regular Letter Or File?
If Not, It's Time To Explore GEAP.

GEAP Stands For Graphics Editor And Programmer.

Depending On Your Hardware & The GEAP Package You Choose, You Can Create Diagrams,
Figures, Flyers, Posters, Letterheads And Artwork With Ease.

Using GEAP Does Not Require Basic Programming Knowledge, However We Have Facilities To
Allow Programmers To Create Screen Formats And Program Documentation Within Their
Programs With Ease.

We Offer GEAP In Modular Form. You Can Get It All At Once Or Purchase It In Pieces As Your
Needs Or Hardware Grows.

**FLEXIBILITY, EASE OF USE, AND EASY FUTURE EXPANSION IS
WHAT GEAP IS ALL ABOUT.**

GEAP Regular Facilities — 16K-48K Disk, Stringy, or Cassette Supported.

Sample Commands & Facilities In The Basic GEAP Package:

MODES: Alphanumeric, Graphics, Single Graphic Pixels Can Be Intermixed. Free Style Drawing,
Create Composites From 2 Or More Drawings, Reverse Graphic Pixels (Selectively), Graphic Block
Moves, Graphics Keypad, "Paintbrush", Magnification, Rotation, Save Screen As Basic Program
— ASCII Compatible, Compressed, Or String Format.

OPTIONAL MODULES & PACKAGES:

MODULE 1 — More rotation, Magnification, & Other Powerful Commands.

MODULES 2-4 — Letterset Modules. Instant Letters, No Drawing Required. This Is How We
Created The "GEAP" Cube Letters In 4 Keystrokes.

MODULE 5 — EPSON Printer Support Module. Now Non-Programmers Can Use The EPSON
MX-80 To Print Their GEAP Creations — Posters, Flyers, All With Epson Quality.

GEAP 48K DISK — You Get Module 1-5, & Additional Disk Related Features. Expansion
Modules Run Via Menu Selections. If You Have The Hardware, This Is The GEAP For You.

NEWSSCRIPT Support Package — All Of The GEAP 48K DISK Commands, Plus Facilities To
Interact With NewScript. Now The Perfect Marriage, Word Processing & Graphics Processing.
Requires Current NewScript Update.

**Olympic Decathlon
Model I, 32K Disk \$29.95
Microsoft, Inc.
400 - 108th Ave. N.E.
Bellevue, WA 98004
(206) 454-1315**

Olympic Decathlon, by Timothy Smith of Microsoft, has to be one of the all-time greats in the TRS-80 lineup of gaming software. More than just a simple game, it is a cleverly designed simulation of the Decathlon, the ultimate test for an athlete.

The program is available on either disk or cassette, but only the disk version was tested. The package consists of one diskette and a 48-page instruction manual. The diskette may be backed up once. It is then rendered uncopyable by normal means. A replacement diskette may be obtained for \$7.50 from Microsoft. After backing up the original, the disk is booted and then a spectacular graphics display dazzles the user.

Each event is presented in order, with one or two athletes competing at the same time. The computer puts contestants in random order so that if more than two are competing, the same two contestants do not compete against each other in all of the events. The first event is the 100-meter dash. The screen displays an oval track, complete with start and finish lines. The runners are depicted with two black squares on the white track. The starting gun is displayed, and when the "go" flag appears, the runners dash toward the finish line as the elapsed time indicators keep track of each runner. False starts are disallowed and will start the race over. After each event is over, the standings are displayed.

The next event is the long jump, which is displayed as a runner on a white line at the bottom of the screen with a small break that represents the take-off line. It takes much coordination to control the jump and keep from committing a foot fault or a face fault.

The shot put is cleverly displayed with the upper torso of a man and his arm. The up-arrow and left-arrow keys are pressed in unison to propel the shot upward and outward. It is difficult to score well in this event and split second timing is involved.

The high jump is similar to the long jump, except that a crossbar is displayed in front of a foam rubber landing pit. The contestant attempts higher and higher jumps until all players are eliminated. This one takes good coordination and timing also.

The 400-meter dash is similar to the 100-meter dash, only one complete lap is run. It becomes fatiguing for the fingers, just as it does for legs in the real thing.

The 110-meter hurdles is my favorite event. A single runner is displayed on a flat track with one meter markings. The hurdles are at various distances. The runner is very life-like and the animation is excellent. This event takes good timing to prevent knocking down the hurdles.

The discus throw is one of the most difficult to master, exceeded only by the pole vault. The discus must be released at precisely the right time in order to keep it in bounds. High scores come only with hours of practice.

**PRIZE WINNING

Reviews

The pole vault requires more skill than any other event, both in the real world and in this simulation. Each contestant must make a running approach with the arrow keys, plant the pole in the small vault box, raising to a handstand on the pole, and then releasing at the apex of the vault to clear the bar and land in the foam landing area.

The final events are the javelin throw and the 1500-meter run. The javelin thrower runs up at a constant speed to the arc line, tilting the javelin as he approaches the line. The javelin must be released before the runner crosses the line and at the proper angle to get good distance. This event takes a lot of practice to get good scores.

In the 1500-meter run, two runners compete on the oval track again. This time, the runners are controlled by pressing four keys that control up, down, right and left. It is a little tricky to round the far curves using this system, as two keys must be pressed simultaneously. Sometimes, the runner gets stuck on the track because the player presses the wrong key. At least your fingers don't get tired from "running" as in the other running events.

Olympic Decathlon is a lot of fun to play, as well as being entertaining and educational. My keyboard gets a real workout from all of the athletes around the house. Tim Smith deserves a lot of credit for this magnificent creation. This is the type of program that really shows off the capabilities of our wonderful little micro machines.

After playing several million games in which I had to attack alien monsters, I was getting tired of doing all of the killing. I wanted to be the monster for a change! Well, along came Epyx to the rescue! Finally, a company has created a game that will allow me to do a little ravaging of my own, and permit me to be the monster against all of the other "good guys". This game, perhaps a revolutionary one, is called "Crush, Crumble and Chomp", appropriately enough, since those three verbs are what this exciting game centers around.

One of the major differences in this game besides the reversal of roles, is that it is written almost entirely in BASIC. That came as sort of a shock to me since most "professionally made" games I had ever seen were in machine language. Crush, Crumble and Chomp is not a real time arcade game, so BASIC is allowed. However, this makes for some rather slow action on the computer's part. Plan to spend a lot of time if you want to successfully finish this game.

After loading in the game, setting the memory size to 31166 and using the CLOAD statement, I was ready to go. I entered the command RUN, and the title page appeared. Following that, an option list came up on the

screen. In the option list, I could choose from six different monsters, five objectives and four cities. With all of these options, there are over 100 different games within one program! I believe that this feature, along with many others, help make up a well-balanced simulation.

There are five different objectives to the game. The first is known as "balanced". In this objective, I can score for anything I destroy. Following this is the "killer monster", in which a few points may be obtained by destroying buildings, and a great deal of points for killing humans. (This game can get rather violent.) The third one of the list is "combat machine." That gives a few points for smashing things and a great deal for destroying the army (in case the monster is anti-draft!). "Destruction" mode gives a large number of points for destroying bridges and buildings, and relatively fewer points for humans. Last, there is "survival" mode, which is probably the most basic—stay alive. The longer the monster survives, the more points are scored.

I was particularly impressed by the option of choosing a city. The four given are New York City, Golden Gate (San Francisco area), Washington D.C., and Tokyo. All of these have different areas, and all four maps are included in the very complete documentation.

After completing these three decisions, I press the ENTER key, and the data begins to load in. Once this is complete, the game begins. I always make sure that my amplifier is hooked up, because there is sound in this game. Though it's not the best I've ever heard, it still adds a lot to the game and should not be ignored.

The screen fills up quickly with a variety of graphics and text. Filling up most of the screen is a section of land and water (depending on the city I am in). Of course, the area displayed is not the entire city, but only a small section of it. The maps show the starting point of land and amphibious creatures, so that I know where to begin my path of terror and destruction.

Of course, there is a wide variation with each of the monsters as to how much potential I have to destroy, and what commands I can use to destroy. However, some of the more common possibilities are to (C)rumble, (B)reath fire, and (O)bliterate. Some of the more specialized commands for different monsters include (U)ltrasonic scream, (T)ail, (P)aralyze, and (F)ly. While playing the game, I may hit the number sign (#) at any time to check my current score, and may continue playing until I am destroyed or starve.

I would recommend Crush, Crumble and Chomp to any owner of a Model I or III cassette or disk system who enjoys simulations, or is just sick of being the good guy. However, to the arcade game lover, this program is not for you. It's a little too slow, and doesn't quite offer the action of, say, Galaxian or Alien Defense. Therefore, my recommendation is restricted, but my respect for the program and the programmer is high. The program is very well done, the graphics (for all they are worth) are utilized, and the documentation is hilarious, but informative and complete. Perhaps Wang Lew and I could start a movie.

Tim Knight

Tandy topics

Ed Juge, Director, Computer Merchandising, Tandy Corp.
1500 One Tandy Center, Fort Worth, TX 76102

You've heard me discuss many times, the fact that we can't repair modified TRS-80s. We reserve the right to void your warranty if a unit has been opened or modified. We can't be responsible for non-Radio Shack parts installed, etc. Officially, our policies have been pretty much as stated.

Unofficially, we've allowed our service center personnel to determine when special cases warranted special handling. We ended up with some inconsistencies, though, where one repair facility would agree to work on a unit after another facility had refused. The good news is that we think we've learned quite a bit about what we can do effectively, and what we can't.

About the first of March, a letter went out to all of our service centers, giving them specific guidelines on what to do with TRS-80s which aren't completely "stock". Since it will undoubtedly make a lot of you very happy (and since I think it shows a real effort on the part of our support operations management to increase our level of service), I'd like to tell you about these guidelines.

Up front, let me say that there are some "maximum parts/labor charges" for certain completely stock equipment. Those charges will not apply to units which are "non-stock" in any way. With that caveat, we'll proceed.

First of all, let's look at the case of RAM chips. Those of you with "stock" TRS-80s containing Radio Shack chips: we will replace only the defective chips we find, not a whole set. If you've installed "foreign" RAMs, and we find one or more of them defective, the service center is

still required to replace a complete set or none. They will, however, call and give you the option of doing it yourself or having us do it. There will be a checkout fee charged for our time, even though no service is performed.

Foreign Disk Drives

We have said many times that we can't work on Model IIIs which contain non-Radio Shack drives. Well, our folks tell us that they will accept such units for service . . . partly! This means that if the drives work properly, we will simply overlook them. If the drives are at fault, we will disconnect them, check or repair the "stock TRS-80" portion of your computer, and let you handle any drive problem with the vendor or the dealer who installed them.

I still issue a strong warning to the non-technical reader. This leaves you in the dangerous position I've described before, that Radio Shack will guarantee the operation of our equipment, as the drive vendor may guarantee his drives. But, you'd better be sure someone guarantees that they will work together, unless you have the knowledge and equipment to do it yourself. Now for my sales pitch. A few freight bills or "figure it out as we go" repair bills by a third party can more than eat up your savings.

Modifications

This one's a bit harder. If a modification doesn't appear to be hurting anything, we'll disregard it. If we can't properly check out the unit, or if the modification seems to be causing the problem, we'll ask your permission to remove it. If you decline, you'll pay only the checkout

fee. Otherwise, we'll remove it, return the parts to you, and effect repairs.

There is one big "gotcha". When there are "cuts and jumpers", or damage to the board such that our repair people back here in Fort Worth won't accept it for rebuilding on an exchange basis. If your computer qualifies, then your only option may be to repair it yourself, or authorize us to install new circuit boards on a non-exchange price basis.

Our repair people will always return any non-Radio Shack parts, whether you request them or not. We've always done this if you requested it when you brought the unit to us, but some of you asked only when you picked your computer up . . . after the parts had been thrown out or mixed up with other defectives to the point that they could not be identified.

There are a couple of other clauses in the new policy that you should be aware of. If our people feel that the computer poses any kind of safety hazard to the service technician, they may refuse to service it at all. Our after-service warranty will specifically exclude the operation of any non-Radio Shack parts or modifications which we leave installed. Also, TRS-80 equipment containing non-Radio Shack parts or modifications cannot be covered by our maintenance agreements.

Having opened, modified, or installed your own parts, no longer automatically excludes Radio Shack service on your TRS-80. It can, however, cause that service to cost you more. A trip to our repair center will not necessarily assure a working computer if your non-stock parts are faulty. See you in June. ■

High-res graphics for the Color Computer

Generate alphanumeric characters in high-resolution mode

Richard Tangeman, Arkansas State University, AR

Color Computer

The high-resolution graphics capabilities of Radio Shack's Color Computer are impressive when compared with other machines in its price range. One problem in applying this power is that it is not possible to mix high-res graphics and ordinary text on the same screen. We present here a short, easy-to-use subroutine, written in BASIC, which allows the display of commonly used characters on the graphics screen in PMODE 4. To see which characters are available, see Figure 1 or execute:

```
FOR I=32 TO 95:PRINT CHR$(I);NEXT I
```

from the direct mode.

Any string built from the available characters may be displayed starting at any point on the graphics screen. To set up the subroutine array, execute GOSUB 915 at the beginning of your main program. When a string is to be displayed, load it into A\$, set the horizontal and vertical tab values HT and VT, and execute GOSUB 800. HT should be an integer value 0-39, and VT an integer value 0-15, where columns are numbered left to right and rows numbered top to bottom. The subroutine does not check to see whether these values are in range. The values of HT and VT are, however, saved by the subroutine in order to allow the use of these variables as loop counters in the calling routine. Thus, the code:

```
A$="?":FOR HT=0 TO 39:FOR VT=0 TO 15:GOSUB 800:NEXT:NEXT
```

may be used to fill the screen with question marks, column by column. (Warning: This will take about 20 minutes!)

The characters are built in the usual 5 x 7 dot matrix and stored, one byte per row, in the string array A\$(). To see how this is accomplished, consider the question mark, CHR\$(63).

In each row, the five available dots are numbered zero to four from left to right. In the top row, we want bits one and two to be turned on, and $2^1 + 2^2 = 6$. In order to avoid using control characters for row storage, we add 64 to this, obtaining 70, and store the first row as "F", which is CHR\$(70). In the next row, bits zero and three are to be set, so we use CHR\$(64 + 2⁰ + 2³) = "I". Continuing in this manner, we get "FIHDD@D". This resides in A\$(31) and in general, A\$(K) holds the coded

rows of CHR\$(K+32) as K ranges from zero to 63.

With an understanding of this technique, the character set may be redesigned as desired, or extended to include, for example, the lowercase alphabetic characters.

It is also possible to use this routine to display rough-but-readable strings in the lower-resolution graphics modes. To see the effects of this, replace line 20 in the listing with: 20 PMODE 3,1.

Although a few characters are rather badly botched, most strings (particularly those involving only alphanumeric characters) are still easy to read.

PMODES 2, 1 and even zero, may also be used, with character quality declining as expected.

Figure 1

A screen dump of the characters generated with this program.

```
!""##%&'<>+,-./0123456789!;,<=>?
@ABCDEFGHIJKLMNPOQRSTUVWXYZ[\]^_`
```

Program Listing

High-Res Graphics on the Color Computer

Note: The underscore character in the DATA statements of this listing must be replaced with a left arrow (obtained with SHIFT-UP ARROW on the Color Computer). The right open bracket is obtained using the SHIFT DOWN-ARROW and the backslash is obtained using the SHIFT-CLEAR keys. With these conventions, you should have no trouble entering the correct code in the DATA statements. —Ed.

CONVERT YOUR TRS-80 MODEL-I INTO A DEVELOPMENT SYSTEM

Now you can develop Z-80 based, *stand-alone* devices such as games, robots, instruments and peripheral controllers, by using your TRS-80 as a development system. The DEVELOPMATE plugs into the expansion connector of your TRS-80 and adds **PROM PROGRAMMING** and **IN-CIRCUIT-EMULATION** capabilities to your system (with or without expansion interface).

Complete instructions and sample schematics are included to help you design your own simple stand-alone microcomputer systems. THESE SYSTEMS CAN BE AS SIMPLE AS FOUR ICs: one TTL circuit for clock and reset, a Z-80, an EPROM, and one peripheral interface chip.

When the In-Circuit-Emulation cable is plugged into the Z-80 socket of your stand-alone system, the system becomes a part of your TRS-80. You can use the full power of your editor/ assembler's debug and trace programs to check out both the *hardware and the software*. Simple test loops can be used to check out the hardware, then the system program can be run to debug the logic of your stand-alone device.

Since the program is kept in TRS-80 RAM, changes can be made quickly and easily. When your stand-alone device works as desired, you use the Developmate's PROM PROGRAMMER to copy the program into a PROM. With this PROM, and a Z-80 in place of the emulation cable, your stand-alone device will work by itself.

The DEVELOPMATE is extremely compact: Both the PROM programmer and the In-Circuit-Emulator are in one small plastic box only 3.2" x 5.4". A line-plug mounted power supply is included. The PROM programmer has a "personality module" which defines the voltages and connections of the PROM so that future devices can be accommodated. However, the system comes with a "universal" personality module which handles 2758, 2508(8K), 2716, 2516(16K), 2532(32K), as well as the new electrically alterable 2816 and 48016(16K EEPROMs).

The COMPLETE DEVELOPMATE 81, with software, power supply, emulation cable, TRS-80 cable, and "universal" personality module, is ONLY \$329! The PROM PROGRAMMER is available *separately* for ONLY \$239.

Notes

Here are some short tips which will help you to understand the mechanics of converting HEX numbers to their decimal equivalent.

Remember that in HEX:

- A = 10
- B = 11
- C = 12
- D = 13
- E = 14
- F = 15

Whenever you see a HEX number and need to convert it to decimal, don't panic. Just simply invert the number and follow the format described below. You should have no trouble determining the equivalent decimal number. Assume you have a number like FF01H where the H signifies that this number is in hexadecimal.

HEX Number	Multiply By	To Obtain
1	1 1 x 1 = 1
0	16 0 x 16 = 0
F	256 15 x 256 = 3840
F	4096 15 x 4096 = 61440

As a final step, add all of the decimal numbers to the right of the equal sign in the third column to obtain:

$$\begin{array}{r}
 1 \\
 0 \\
 3840 \\
 +61440 \\
 \hline
 65281
 \end{array}$$

Therefore, FF01 HEX is equivalent to 65281 decimal. If you have a HEX number with only three digits, say F01H, then there simply won't be a number to be multiplied by 4096.

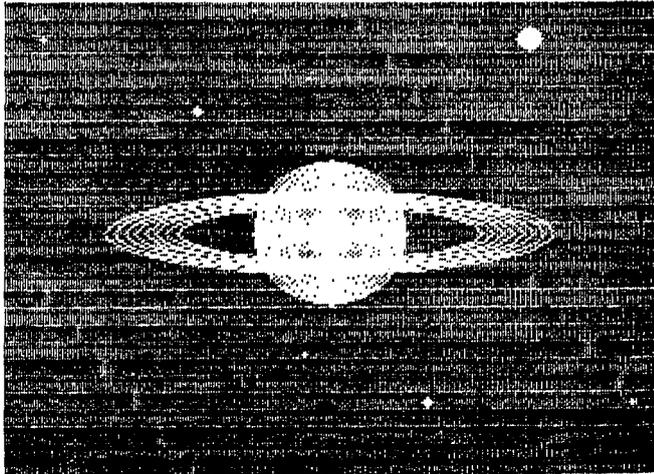

Likewise, for a two-digit HEX number. Here, the last two digits will be missing and so there won't be multipliers. The first digit will be multiplied by one (1) and the second digit will be multiplied by 16. Add up the resulting numbers and the result will be the decimal equivalent.

This method will apply for all HEX numbers whether you have a Model I, Model II, Model III, or Color Computer.

Ronel Elul, of Beverly Hills, California, sent us this "one-liner" which does most of what James William's machine language program does in the February 1982 issue:

```

10 REM DEPRESS PLAY AND RECORD KEYS ON RECORDER,
DISCONNECT REMOTE PLUG
20 REM FOR DISK SYSTEMS ONLY: CMD" T"

40 REM MAIN PROGRAM
  
```

Saturn

This short program will reproduce a picture of Saturn as shown above. The picture is a screen dump to a Line Printer VII using the screen dump software driver provided by Radio Shack. If your Color Computer contains the new ROM (version 1.1) you won't need the software driver.

Don Scarberry, Editor

```

1030 GOTO 1030
```

Model III owners might have trouble using the FORMS command on the disk systems. The FORMS command will allow you to set the number of characters per printed line and the number of lines per page. The problem is that this command seems to add two additional characters to each line. If you select a 60 character line, the actual printed line will contain 62 characters. Radio Shack tells us they are currently working on a fix.

With the 16K Extended BASIC Color Computer you cannot type in a line containing 256 characters. Here is a way to get a few more characters: When you have typed the 249th character in a line, press the ENTER key. Type EDIT (line number). Press X (ENTER). You should now be at the end of the line and will be able to enter up to three more characters for a total of 252.

This procedure is known to work on a 16K Extended BASIC Color Computer with the original 1.0 ROM. We would like to hear from anyone who has this problem on other versions of the Color Computer. ■

WHY

IS THE ALPHA JOYSTICK SUCH A SUCCESS ?

Because of games like these.

THE LATEST BLAST FROM BIG FIVE...

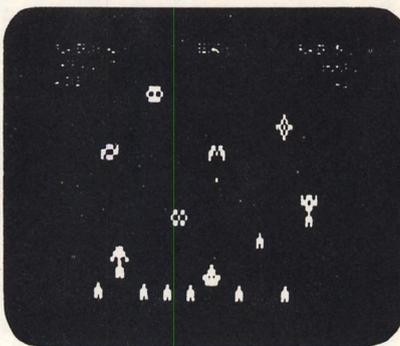

NEW! DEFENSE COMMAND

ALL GAMES:

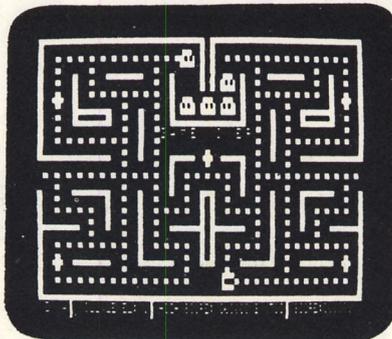

16K Level 2, Mod 1 + Mod 3 Cassette: \$15.95
32k Level 2, Mod 1 + Mod 3 Diskette: \$19.95
10% discount for 2 games, 15% for 3 or more
Games may be played with or without joystick.

SCARFMAN

Actual unretouched photos

DEFENSE COMMAND

Big Five has done it again! Now the most popular arcade game of all time has a fascinating new twist. The Invaders are back! You are alone, valiantly defending the all important nuclear fuel cannister stockpile from a convoy of thieving aliens who repeatedly break off and attack in precision formations. An alien passes your guard, swiftly snatching up a cannister and flying straight off. Quick! you have one last chance to blast him out of the sky. Great action and sound!

SCARFMAN

THE LATEST ARCADE CRAZE now runs on your TRS-80.

It's eat or be eaten. You control Scarfman around the maze, gobbing up everything in your path. You attempt to eat it all before the monsters devour you. Difficulty increases as game progresses. Excellent high speed machine language action game. From The Cornsoft Group. With sound.

CAUTION: Played with the Alpha Joystick, Scarfman may become addictive.

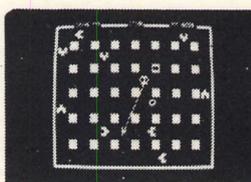

SUPER NOVA®

Asteroids float ominously around the screen. You must destroy the asteroids before they destroy you! (Big asteroids break into little ones.) Your ship will respond to thrust, rotate, hyperspace and fire. Watch out for that saucer with the laser! As reviewed in May 1981 Byte Magazine.

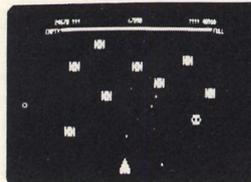

LUNAR LANDER

As a vast panorama moonscape scrolls by, select one of many landing sights. The more perilous the spot, the more points scored —if you can land safely. You control LEM main engines and side thrusters. Absolutely the best use of TRS-80 graphics we have ever seen! From Adventure International. With sound.

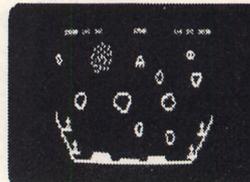

ATTACK FORCE®

As your ship appears on the bottom of the maze, eight alien ships appear on the top, all traveling directly at you! You move toward them and fire missiles. But the more aliens you destroy, the faster the remaining ones become. If you get too good you must endure the "Flagship"... With sound effects!

COSMIC FIGHTER®

Your ship comes out of hyperspace under a convoy of aliens. You destroy every one. But another set appears. These seem more intelligent. You eliminate them, too. Your fuel supply is diminishing. You must destroy two more sets before you can dock. The space station is now on your scanner... With sound!

METEOR MISSION II®

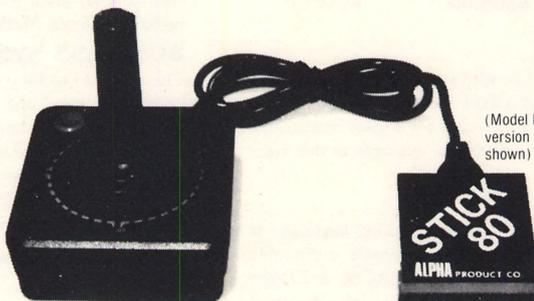

As you look down on your view, astronauts cry out for rescue. You must maneuver through the asteroids & meteors. (Can you get back to the space station?) Fire lasers to destroy the asteroids, but watch out, there could be an alien FLAGSHIP lurking. Includes sound effects!

THE ALPHA JOYSTICK: REAL ARCADE ACTION

ONLY \$39.95 (MODEL I)

- Features the famous ATARI JOYSTICK
- Works with any Level II or disk system
- Plugs directly into KB or E/I (next to printer port)
- Compatible with any other TRS-80 accessories
- Saves your keyboard
- Fun to experiment in BASIC. Simply use A=INP(0) to read the joystick
- Fully assembled, ready to plug in and use.

Price includes Atari Joystick + Alpha Interface + instructions + demo program. The Alpha Joystick is backed by an unconditional money back guarantee. If you are not delighted with it, return it within 14 days for a prompt and courteous refund.

SUPER LDOS DEVELOPMENT PACKAGE

LDOS + LC + FED + LED + EDAS + FILTER PKG. + MONITOR	\$369.00	\$144.00
--	----------	----------

**Offer good during April & May, 1982

FED - THE LDOS FILE EDITOR

This is the ultimate in file "ZAP" type tools for use with your LDOS system. Full access to files, ASCII and HEX searches, find a load address or where a byte loads. Full HEX or ASCII modify, even to the directory. Two display modes and a built in menu plus unique features that have never been available in this type of system tool. Available now for just... \$40.00

LC - LDOS "C"

This is a very powerful implementation of the "C" programming language. It comes complete with an extensive function library and generates executable code or assembler source that is compatible with either the MAC-80 or EDAS. For efficient creation of both systems and applications code, this is the language. The language of the future now for just... \$150.00.

LED - LDOS TEXT EDITOR

This is the official LDOS text editor designed for writing and maintaining almost any type of text. Handles both line number and unnumbered text files with word processor like functions. Great for all types of pure ASCII source files, even BASIC, and for PATCH and JCL files. Many special features make this editor a "must have" program for the serious user. Finally, a functional text editor for just... \$30.00.

FILTER PACKAGE

This package is a collection of powerful filter for the LDOS "devices" to bring out the true power of the LDOS concept. Included are a HEX-DECIMAL-BINARY-CALCULATE-CONVERT filter for your keyboard, a filter to expand basic code to a formatted structure during listing and a complete translations filter to convert any or all 256 possible characters to other characters even in a by directional mode. Use this package to give your system a DVORACK keyboard or to have your system talk in EBCDIC. Many, many handy additions to your LDOS system for just... \$60.00.

MONITOR - THE LDOS DISK I/O MONITOR

This program brings to LDOS the power of a mini or mainframe error monitor system. When a disk error of any sort occurs, the monitor takes control and allows the operator to select: ABORT, CONTINUE, RETRY or IGNORE. This allows recovery from many problems that before would have caused the loss of data or the interruption of program. Don't let a simple parity error ruin your day again! Get the program that pays for itself the first time it does its job. Be in control of your system for just... \$25.00.

MAILING SYSTEMS - MAIL/FILE-SERIES II

NEW Series II Mail/File has all of the outstanding features of the original Series I Mail/File, PLUS many additional qualities which again will set standards for this type of system. "Word processor" type input editor, fast sorting, and fabulous editing capabilities are a few of its features. Name and ZIP code are under constant sort. A really great Mailing List-Data Base manager. Model I system will handle up to 600 names. Model III system will handle up to 1200 names... \$159.00

BUSINESS SYSTEMS - INVENTORY MASTER SYSTEM

The program to fill your needs. Control up to 2700 items. With today's market, keeping on hand only what your demand calls for is reason enough to let your TRS-80 accurately and effectively take care of your inventory. Always know what to stock and when to stock it. This system has many features which were modeled after a main frame system of large capacity. Model I version just... \$159.00. Model III version just... \$259.00. Also available for the Model I or III Stock Market Monitor: Cassette version... \$89.00. Disk version... \$99.00.

Money orders, credit cards & cod's shipped within 24 hours.

Increase Your Productivity With a Radio Shack TRS-80® Personal Computer

Here are two personal productivity tools that are an aid to any busy manager. They let you spend more time managing and less time "pushing a pencil." Our Time Manager™ program helps you organize your busy schedule, showing appointments and a "to do" list. It can be your daily organizer, filing system, electronic "notepad", project coordinator, financial assistant, and more. VisiCalc® lets you solve problems, forecast, and analyze the effect of your decisions. And both programs are available for the Radio Shack TRS-80 Model III Desktop Business Computer.

Time Manager: Your Daily Calendar . . . and More! This "electronic" calendar, automatic reminder and filing system lets you plan, organize, schedule and record your daily activities. You assign priority levels and categories to each entry. Then you can view today's agenda—or look ahead at what's coming up. There's even a "to do" list that will follow you from day to day until finished.

Locate Information Quickly. You can scan your year's data for specific information by category and/or keyword. For example, if you select the telephone category and a keyword—such as a person's name—Time Manager instantly locates the calls you made to that person during any designated period, along with your notes concerning each call.

Track Projects, People, and Expenses. Review schedules and progress, examine the frequency of meetings, recall expenses, create financial summaries, and much more with a few simple keystrokes!

VisiCalc: The Professional's Planning Tool. Radio Shack's Model III VisiCalc dramatically improves the way you do financial planning, budgeting, sales projections, job costing, engineering designs, scheduling, product pricing, and even personal financial decisions. VisiCalc is an "electronic" columnar pad. Just define the formulas, enter your figures, and VisiCalc performs all calculations and automatically displays the results. Now change any value or formula on your worksheet, and VisiCalc *instantly* updates every related number! You can view countless "what if . . ." situations in seconds, rather than the hours required with pencil and paper.

The Hardware. TRS-80 Model III is our most affordable desktop business computer. It features two double-density internal disks for 368K bytes of storage (two more can be added externally), a full 48K RAM, a parallel and an RS-232 port, plus a high resolution monitor with upper and lower case characters. We include Model III BASIC, and offer optional languages including COBOL, FORTRAN, Assembler and Compiler BASIC.

We Have Other Ways to Save You Time. Discover electronic filing, word processing, and the many other ways a TRS-80 can increase your productivity! See Time Manager (\$99.95), VisiCalc (\$199), and the 48K 2-Disk Model III (\$2495) or our other Model IIIs (as low as \$699) at a Radio Shack Computer Center, store or participating dealer near you today!

TIRED OF WAITING?

Frustrating isn't it! No matter how much you speed up your program it still seems to take forever to save data onto a cassette. Wouldn't it be great if someone could design a mass storage system with the speed of a disk, but at half the cost? Exatron did, the *Exatron Stringy Floppy (ESF)*.

Totally self-contained, the ESF is an extremely fast, reliable, and economical alternative to cassette or disk storage of programs or data. All of the ESF's operations are under the computer's control, with no buttons, switches, knobs or levers to adjust or forget.

The ESF uses a miniature tape cartridge, about the size of a business card, called a wafer. The transport mechanism uses a direct drive motor with only one moving part. Designed to read and write

digital data only, the ESF suffers from none of the drawbacks of cassettes - without the expense of disks.

Several versions of the ESF are available, for the *TRS-80*, *Apple*, *PET*, *OSI* and an *RS 232* unit. Even the slowest of the units is 15 times faster than a cassette, and all are as reliable as disk drives - in fact a lot of users say they are *more* reliable!
